

Discussion of the leveling network geometry needed for the SIRGAS vertical reference system realization

SIRGAS Working Group "Vertical Datum" (WG3):

Roberto Teixeira Luz	IBGE, Brasil
Alfonso Tierra	ESPE, Ecuador
Graciela Font	UNLP, Argentina
Héctor Rovera	SGM, Uruguay
José Napoleón Hernández	IGVSB, Venezuela
Juan Francisco Moirano	UNLP, Argentina
Laura Sánchez	DGFI, Alemanha
Luis Alberto Echevers	IGNTG, Panamá
Melvín Jesús Hoyer Romero	CNC, Venezuela
Sílvio Rogério Correia de Freitas	UFPR, Brasil
Wilfredo Rubio Salazar	IGM, Chile
William Martínez Díaz	IGAC, Colombia

IAG2009
31.8 – 4.9, Buenos Aires, Argentina

Background

- 1993: establishment of SIRGAS Project (South America Geocentric Reference System) , with the objective of unifying horizontal systems in South America (WG1: reference system; WG2: geocentric datum)
- 1995.4: first SIRGAS GPS Campaign (58 stations)
- 1997: results presented at IAG Assembly (Rio de Janeiro, Brazil); **efforts changed to Vertical Datum (WG3)**
- 1998-1999, WG3: scientific reports with general concepts and recommendations (e.g. ellipsoidal & physical heights)
- 2000.4: second SIRGAS GPS Campaign (186 stations at the three Americas and Caribe) incl. TGs, intl. connections
- 2001-2002, WG3: operational instructions and recommendations
- 2004-2005, WG3: new scientific report with specific recommendations (W_0 , gravity interpolation etc)

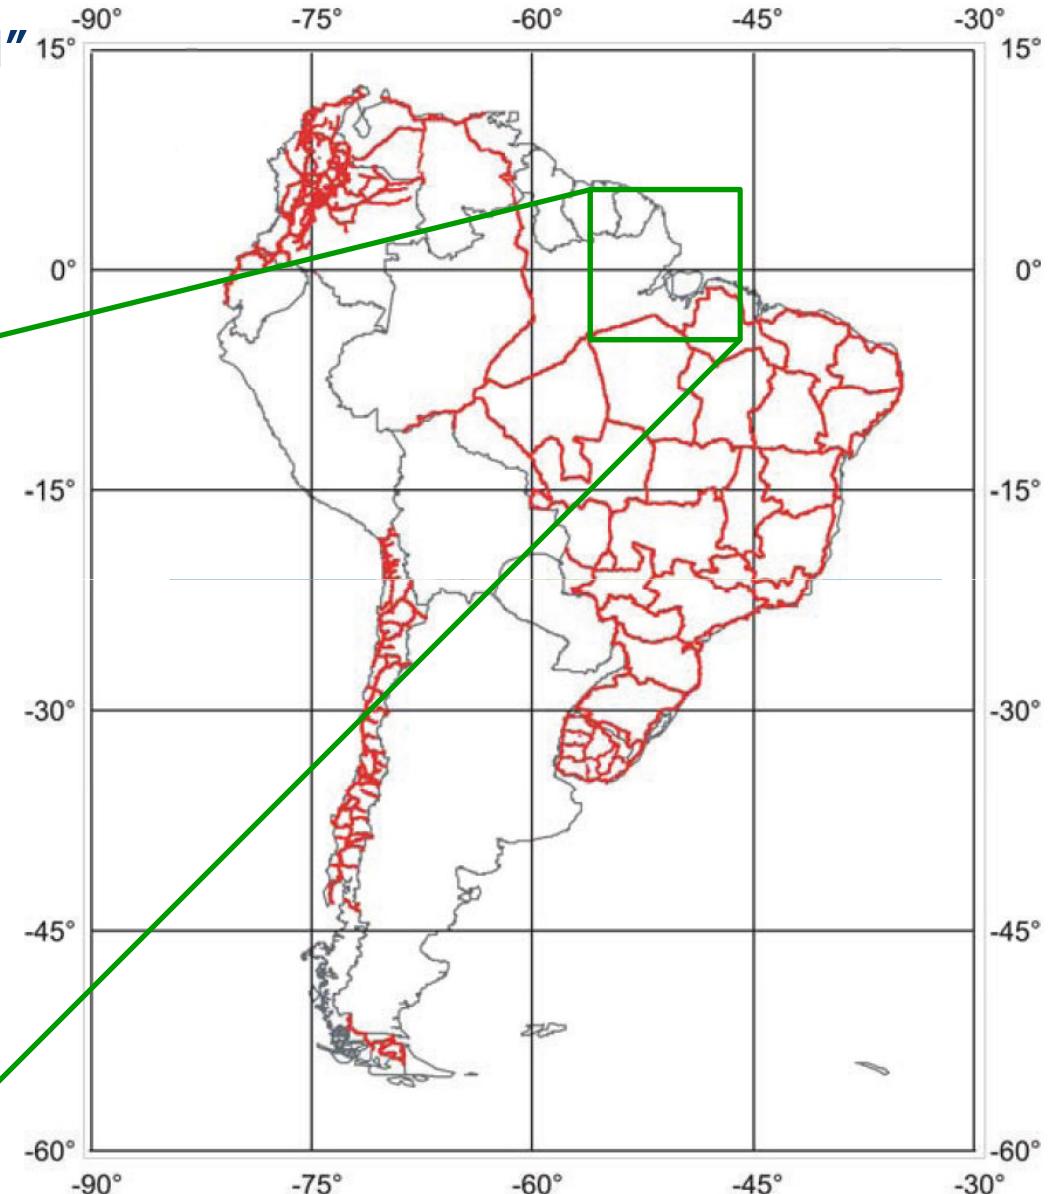

Challenges for a “continental” leveling network

- the Andes
- the Amazon River and forest

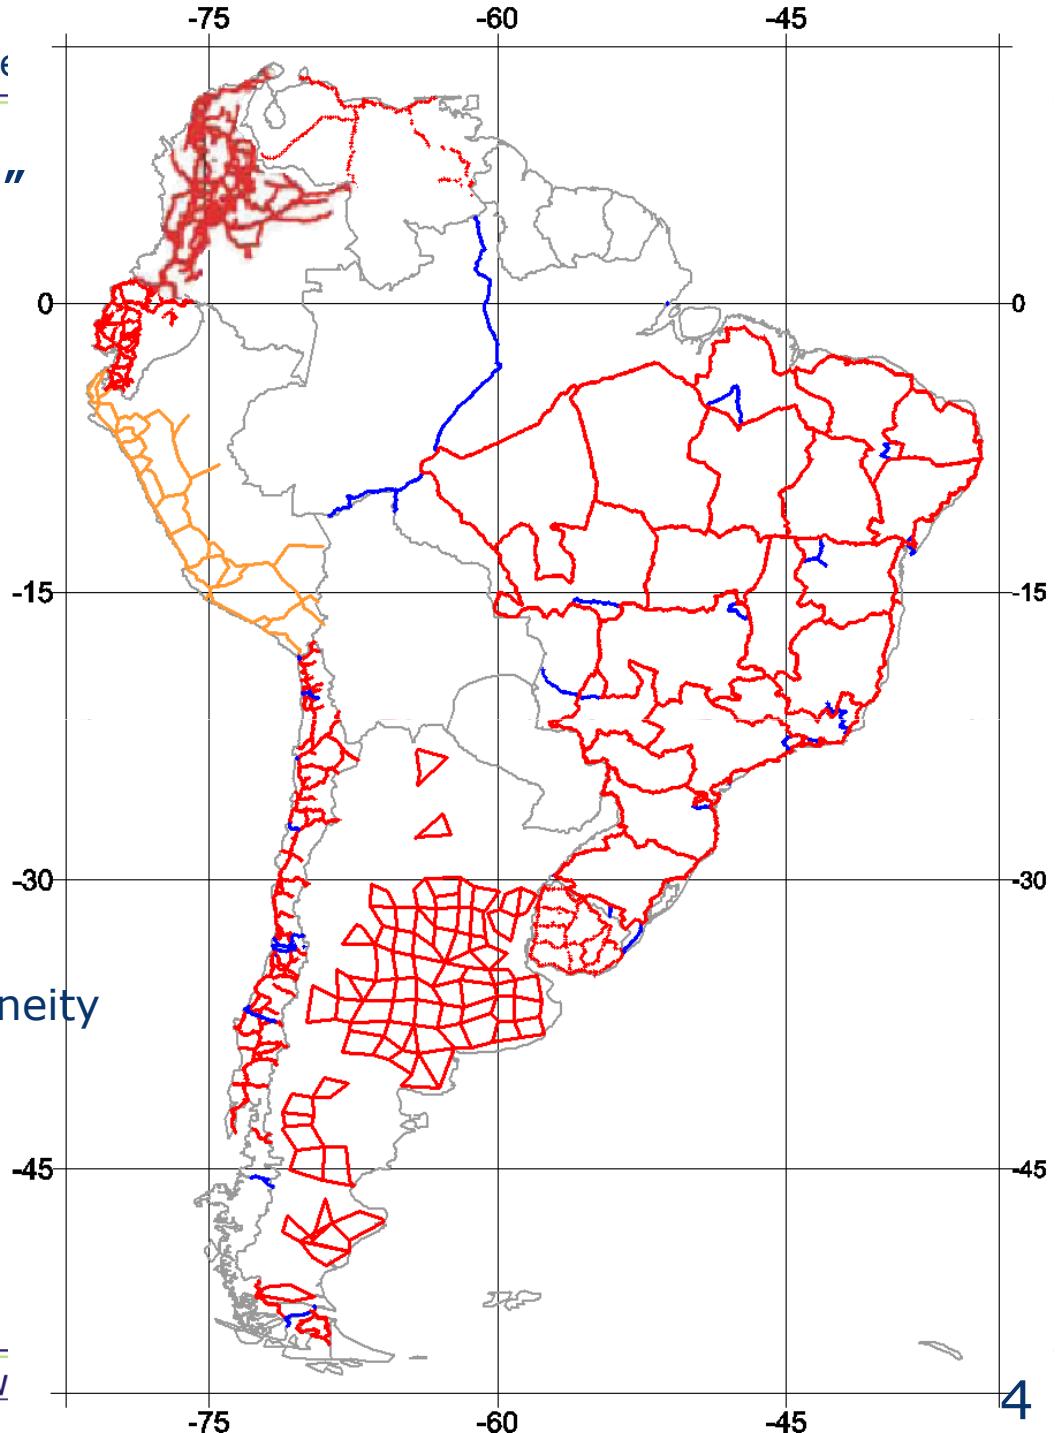

IAG2009, 31.8 – 4.9
Buenos Aires, Argentina

Challenges for a “continental” leveling network (cont.)

- the Andes
- the Amazon River and forest
- the lack of digital data
- the problem (3,5m +/- ?) in the long, open line connecting Venezuela and Brazil
- the spatial and temporal heterogeneity of the data made available
- the lack of gravity

over leveling lines

Case study: Brazilian Fundamental Vertical Network (RAAP)

Differences between new and “historical” heights
(95 cm at Central Brazil)

Global Preliminary Altimetric Adjustment (AAGP,
1993), **INCLUDING** normal-orthometric reduction)

“Historical” adjustments
INCLUDING normal-orthometric reduction)

Geodetic Tide Gauge Network
(RMPG) stations

Standard deviations
(cm) of the new
adjusted heights

Case study: Brazilian Fundamental Vertical Network (RAAP) (cont.)

Effects of the partitioning strategy adopted in AAGP (1993)

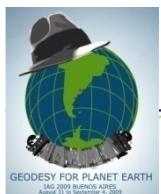

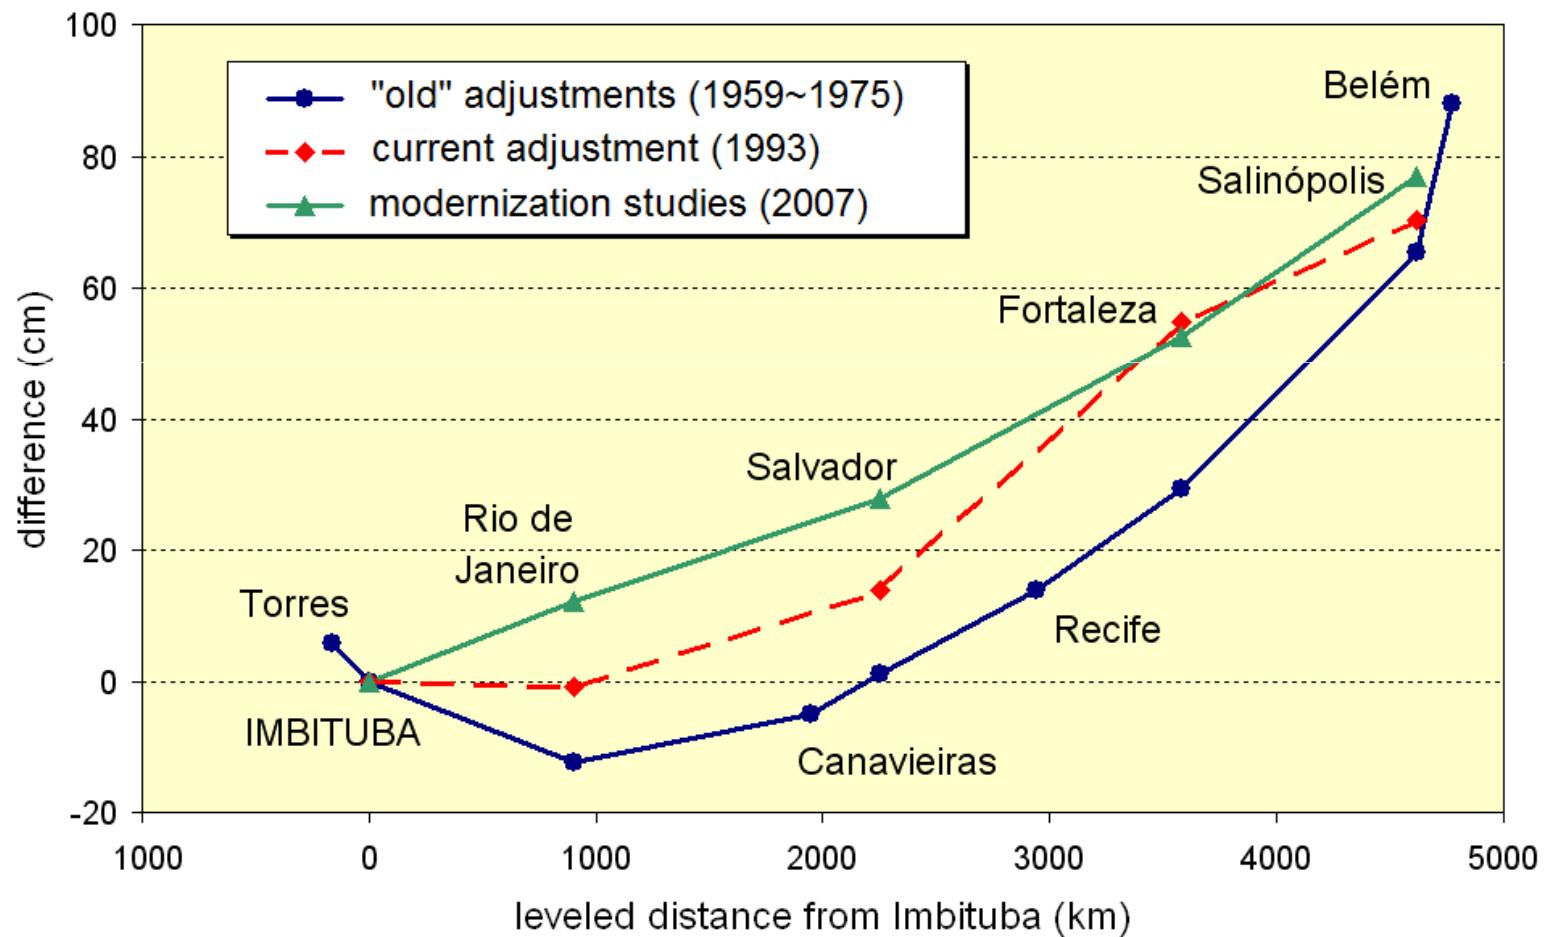

Height differences between
“partitioned-AAGP” and
“full-AAGP” (m)

ranging from +17 cm
to -15 cm

Case study: Brazilian Fundamental Vertical Network (RAAP) (cont.)

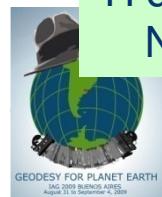

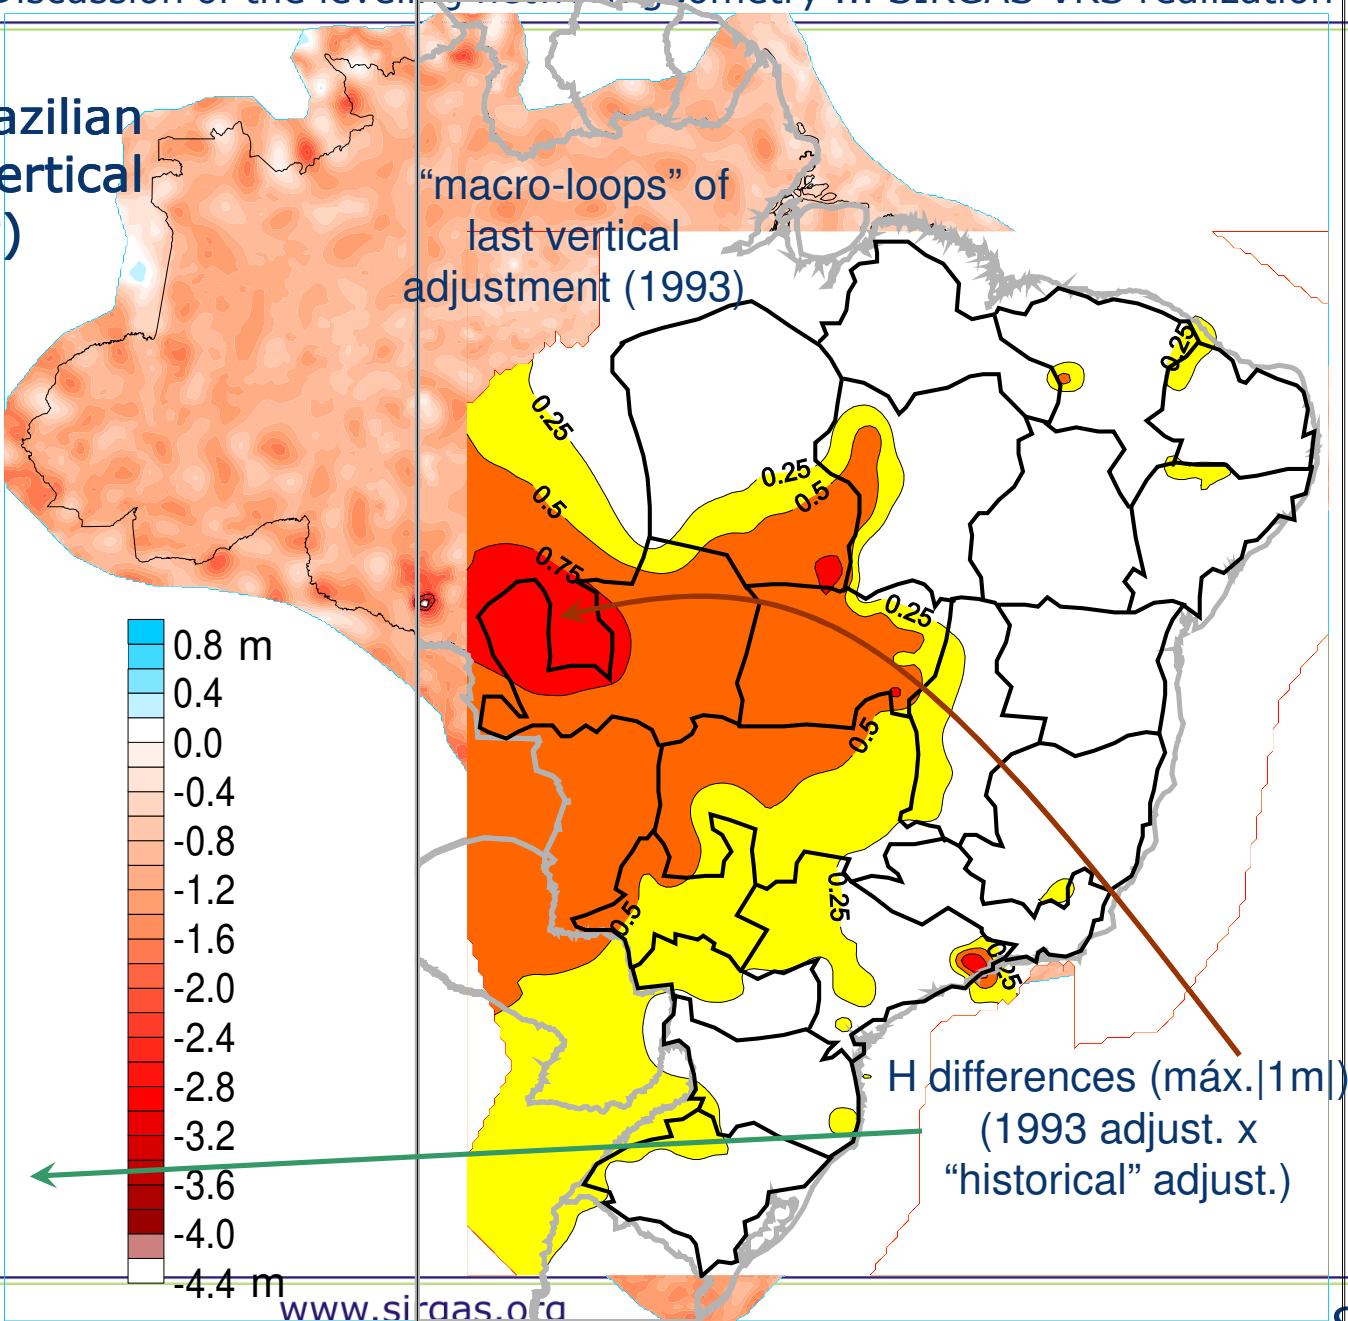

Differences between height values referred to Imbituba and to local MSL

Case study: Brazilian Fundamental Vertical Network (RAAP) (cont.)

N differences
(EGM-96 x
MapGeo2004),
máx.|4m|

Amplification of the
H differences into the
N differences???

Discussions

- care must be taken regarding the selection of leveling lines to be sent to SIRGAS/WG-3 – in principle, the selection should be done after the integration of the information from all the countries
- monument stability? :: it seems that few (if any) deep BMs were established
- there are some investigations under development by different members of WG-3 regarding GNSS-gravity integration and use of zenith cameras
- Brazilian case study: to include new gravity information; to check for the data considered in EGM-96, MapGeo2004 and EGM2008
