1 Introduction

The International GNSS Service (IGS) analyses a global and several regional satellite tracking networks. The global IGS network is processed by ten Analysis Centres (AC), and the regional networks by seven Regional Network Associate Analysis Centres (RNAAC). All the global and regional network solutions are combined to a global polyhedron by two global Network Associate Analysis Centres (GNAAC). The Deutsches Geodätisches Forschungsinstitut (DGFI) is acting as the IGS RNAAC SIR for the Geocentric Reference System for the Americas (Sistema de Referencia Geocentrico para las Americas, SIRGAS).

The IGS decided to introduce the new ITRF2005 (IGS05) solution and to implement absolute phase centre corrections starting with GPS week 1400. To provide homogeneously processed weekly solutions for the complete time span, the IGS RNAAC SIR at DGFI is reprocessing all former weekly solutions since GPS week 0860 (July 1996). This report presents a new position and velocity solution containing the weeks 1199 to 1470 (December 2002 to March 2008).

2 Activities of IGS Regional Network Associate Analysis Centre SIRGAS (IGS RNAAC SIR)

The German Geodetic Research Institute (DGFI) is processing all permanent GPS stations (global IGS and additional regional stations) of South America, Central America, the Caribbean, and surrounding areas. Each week a coordinate solution is delivered to the IGS data centres for combination in the global polyhedron.

At the beginning of the processing in July 1996 (GPS week 0860) the weekly solutions contained only 10 IGS stations. In February 1997, the first regional stations Curitiba (PARA) and Presidente Prudente (UEPP) in Brazil were included. Today the number of processed stations has increased to 189, 131 of them are regional stations (see figures 1 and 2). The development of the number of included permanent stations in the processing is shown in table 1, see also Seemüller and Drewes (1997, 1998, 1999, 2000, 2001, 2004).

Table 1. Development of the number of processed stations by the end of year

Year	IGS Stations	Regional Stations	Sum
1996	15		15
1997	15	6	21
1998	19	10	29
1999	24	14	38
2000	32	16	48
2001	35	17	52
2002	41	18	59
2003	47	19	66
2004	47	28	75
2005	48	55	103
2006	48	72	120
2007	48	128	176
present	48	141	189

Since the year 2000 accumulative combinations of all weekly normal equations resulting in a multi-year position and velocity solution are generated. The first position and velocity solution was DGF00P01, containing 31 stations, all with velocities, followed by solutions DGF02P01 (64 stations, 53 velocities), solution DGF04P01 (85 stations, 72 velocities), and DGF06P01 (120 stations, 101 velocities).

After the introduction of the new ITRF2005 (IGS05, respectively) and the implementation of absolute phase centre corrections since GPS week 1400 the IGS RNAAC SIR at DGFI is reprocessing all former weekly solutions. All weeks are computed with the Bernese GPS software version 5.0. The reference frame is IGS05. 18 IGS05 stations are included as fiducial stations in the IGS RNAAC SIR region (see figure 3). The main characteristics of the IGS RNAAC SIR processing are summarized in table 2.

The time series of several stations show jumps from 2002 to 2003 (see Annex). Therefore the GPS weeks of 2002 have to be reprocessed again. A reason could be the use of approximate coordinates for Arequipa (AREQ) valid before the large earthquake in 2001, which caused a displacement of 66,5 cm in SW direction (see figure 8b).

Two preliminary position and velocity solutions DGF07P01 and DGF07P03 with reprocessed weekly solutions were presented by posters at the AGU Joint Assembly in Acapulco, Mexico, May 2007, and at the AGU Fall Meeting in San Francisco, December 2007. The solution DGF08P01 is described in chapter 3.

At the workshop of the SIRGAS-WGI, held in Rio de Janeiro in August 2006, Experimental Processing Centres (EPC) and Experimental Combination Centres (ECC) were installed. The DGFI was appointed as an ECC. The tasks of an ECC are to compare and to combine the EPC individual solutions and interchange their results within the four weeks following the processed week in order to access the quality of the combined solutions by comparing them with the weekly solutions delivered by the IGS RNAAC SIR (see Sánchez, Seemüller, Krügel (2008)).

Table 2. Main characteristics of RNAAC SIR processing

Software used	Bernese 5.0
Data Sampling Rate	30 sec
Elevation cutoff	3°
Orbits/EOP	IGS final orbits referred to ITRF2005/ IGS05, daily EOP of IGS corresponding to final orbits
Baseline strategy	Number of observations
Observations weighting	$\cos^2(z)$
A priori troposphere model	Zenith delay computed from standard atmosphere/mapped using Niell dry
Troposphere	Zenith delay estimated each 2 hours, mapped with Niell wet
Ambiguities	QIF strategy
Ocean tide model	FES2004
Phase center corrections	Absolute
Coordinates and velocities	IGS05 (ITRF2005)

3 Station Position and Velocity Solution DGF08P01

The multi-year station position and velocity solution DGF08P01 covers the time period from December 2002 (GPS week 1199) to March 2008 (GPS week 1470) with 272 reprocessed weeks. The combined adjustment is done with the programme ADDNEQ2 of the Bernese GPS software and is based on the weekly SINEX files regularly submitted to IGS since GPS week 1400 and the reprocessed weekly solution from GPS weeks 1199 to 1399.

The main features of the adjustment strategy are:

- In a first step the daily normal equations are combined to identify outliers and/or jumps
- Inversion of the weekly reprocessed SINEX files to free normal equations and removing the loose constraints included in the weekly solutions
- Accumulation of all normal equations and parameter transformation from weekly epoch coordinates to coordinates at the reference epoch (here 2004.4) and linear velocities
- Identification of position discontinuities due to episodic effects such as co-seismic displacements or antenna configuration changes, and set-up of appropriate parameters in the combined adjustment
- Introduction of positions (epoch 2004.4) and velocities of fiducial stations selected for realising the reference frame, and application of appropriate condition equations to define the geodetic datum

For the datum realization we adopted position and velocities of the global IGS solution IGS05 as fiducials. The selected stations are ASC1, BRAZ, CHPI, CONZ, CORD, CRO1, GLPS, GOLD, ISPA, LPGS, MDO1, OHI2, PIE1, SANT, SCUB, and VESL, the IGS05 stations MANA and UNSA are excluded. The position and velocities of these reference stations were constrained by NNR and NNT conditions with respect to IGS05 at epoch 2004.4, such that the network is optimally referred to the IGS05 by least squares adjustment.

During the several adjustment processes we detected five stations with discontinuities:

Station	Date	Reason
CONZ	2005 05 17 00:00:00	jump: antenna+radome, receiver change
MANA	2004 10 13 00:00:00	jump
PUR3	2005 01 01 00:00:00	jump
RECF	2005 02 02 00:00:00	jump
CHPI	2005 03 01 00:00:00	jump: receiver change

The figures 4 and 5 show the horizontal and vertical velocities of the IGS05 stations, representing the orientation of the solution DGF08P01, the figures 6 and 7 show the same for all stations. Only stations with at least one year of observations are content of DGF08P01. The tables 3 and 4 contain the coordinates and velocities of the 126 stations, the grey shaded stations are IGS05 stations and the stations with a * have a jump and therefore two coordinate and velocity sets (the Domes No. with a b at the end indicate the set after the jump).

4 Impact of Earthquakes in the SIRGAS Region

The western part of the IGS RNAAC SIR region, i.e. the plate boundary zone between Pacific, Cocos, Nazca plates, and North America, Caribbean and South America plates, is a seismically extremely active area, and therefore earthquakes cause many episodic station displacements. These episodic events with impact on the station positions have to be taken into account in the coordinate and velocity estimates by introducing new position and/or velocity parameters for these stations after an earthquake (Kaniuth et al., 2002; Seemüller et al., 2001, 2002). Figure 8 show the earthquake signals of the four earthquakes happened since the start of IGS RNAAC SIR processing in June 1996, figure 1 show the earthquake locations (see also Seemüller et al., 2004).
