Main Goal:

- In this study, we present and discuss the ionospheric F-region disturbances over South American sector during an intense geomagnetic storm occurred between 27 and 29 May 2017. This geomagnetic storm reached a minimum Dst of -125 nT at 0700 UT on 28 May.
- The vertical total electron content (VTEC) observations from a chain of nearly 120 Global Navigation Satellite System (GNSS) receivers and 2 magnetometers measurements were used. Model data not yet defined.

Data Network

The locations of nearly 120 GNSS receivers (green dots) and 2 magnetometers (orange triangles) over the Brazilian sector used in the present study. The geographic longitude and latitude and geomagnetic equator are also shown in the map.
