1. Introduction

Terrestrial reference frames supporting precise positioning based on global navigation satellite systems (GNSS) must be consistent with the reference frame in which the GNSS orbits are determined. At present, the conventional reference frame is the ITRF (International Terrestrial Reference Frame, <http://itrf.ensg.ign.fr/>), which is computed and maintained by the International Earth Rotation and Reference Systems Service (IERS, www.iers.org). According to the IERS conventions (IERS, 2004), the International GNSS Service (IGS, www.igs.org) determine and provide the GNSS satellite ephemeris referring to the ITRF (Dow et al. 2009). Users applying IGS orbits for processing GNSS positioning have to introduce terrestrial reference stations referring also to the ITRF. The accessibility to this reference frame at regional and local levels is guaranteed through

- 1) Regional (continental) densifications of the global frame, and
- 2) National densifications of the continental frames.

Following this hierarchy, SIRGAS (Sistema de Referencia Geocéntrico para las Américas, www.sirgas.org) is realized by a regional densification of the ITRF in Latin America and the Caribbean (Brunini et al. 2010), and it is further extended to each country by the national reference networks, e.g. SIRGAS2000 in Brazil (Costa et al. 2005), MAGNA-SIRGAS in Colombia (Martínez, Sánchez 2009), SIRGAS-ES2007 in El Salvador (Figueroa et al. 2010), SIRGAS-REGVEN in Venezuela (Drewes et al. 1998), etc.

Initially, SIRGAS was realized by means of two continental GPS campaigns:

- 1) SIRGAS95 including 58 stations distributed over South America observed for ten days in May 1995 and resulting in station positions referred to the ITRF94, epoch 1995,4 (SIRGAS, 1997).
- 2) SIRGAS2000 with 184 stations including the SIRGAS95 points and additional stations located in the Caribbean, Central, and North America. It was measured during ten days in May 2000 and its station positions refer to ITRF2000, epoch 2000,4 (Drewes et al. 2005).

Today, SIRGAS is realized by a network of about 230 continuously operating GNSS stations. This so-called SIRGAS-CON network replaces the first two SIRGAS realisations and allows for permanent monitoring of the reference frame. The SIRGAS-CON network is processed week by week by the SIRGAS analysis centres, who generate weekly solutions for station positions. Based in these weekly solutions, cumulative (multi-year) solutions are computed every year to estimate the kinematics of the SIRGAS reference frame, providing epoch positions and constant velocities of stations operating for more than two years. New SIRGAS-CON stations (operating less than two years and therefore, not included in multi-year solutions) can be used as reference points only, if their coordinates referring to the ITRF are known. According to this, the connection of SIRGAS with the ITRF is carried out in two ways (Brunini et al. 2010): by aligning the loosely constrained weekly solutions to the reference stations used for the computation of the GNSS satellite orbits, and by computing the multi-year solutions referred to the positions and velocities of selected ITRF stations.

The Deutsches Geodätisches Forschungsinstitut (DGFI), as the IGS Regional Network Associate Analysis Centre for SIRGAS (IGS RNAAC SIR, Seemüller and Drewes 2008), yearly computes a cumulative solution containing all available weekly solutions delivered by the SIRGAS analysis centres. These cumulative solutions include those models, standards, and strategies widely applied at the time in which they were computed and cover different time spans depending on the availability of the weekly solutions. Table 1 summarizes the characteristics of the cumulative solutions computed since 2000 for the SIRGAS-CON reference frame.

Table 1. Multi-year solutions computed by the IGS RNAAC SIR for the SIRGAS reference frame.

This report describes the computation of the latest multi-year solution of the SIRGAS-CON network. It is called SIR10P01 and encompasses all the weekly solutions provided by the SIRGAS analysis centres from January 2, 2000 (GPS week 1043) to June 5, 2010 (GPS week 1586). It refers to the ITRF2008 at epoch 2005,0 and provides positions and velocities for 183 SIRGAS-CON stations. Its precision was estimated to be $\sim\pm0,5$ mm (horizontal) and $\sim\pm0,9$ mm (vertical) for the station positions at the reference epoch, and $\sim\pm0,2$ mm/a (horizontal) and $\sim\pm0,4$ mm/a (vertical) for the linear velocities.

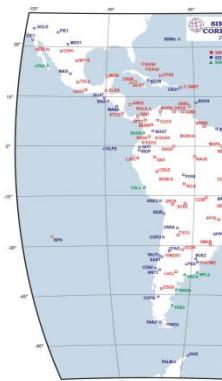

2. Weekly analysis of the SIRGAS-CON reference frame

The processing strategy of the SIRGAS-CON network is based on the combination of individual solutions of different clusters of stations (Brunini et al. 2010). For this purpose, the SIRGAS-CON network is divided in (Figure 1):

- 1) One core network with about 100 stations distributed over the whole continent, and
- 2) Different densification sub-networks distributed regionally on the northern, middle, and southern part of the continent.

The core network is processed by DGFI as IGS RNNAC SIR, and the densifications sub-networks are processed by the SIRGAS local analysis centres in different clusters (Table 2). All of them apply a common procedure established by SIRGAS (in agreement with the IGS standards, Kouba 2009) to generate loosely constrained weekly solutions for station positions (see Annex 1 and e.g. Natali et al. 2009, Seemüller and Sánchez 2009).

Table 2. SIRGAS processing centres and distribution of the SIRGAS-CON stations in different clusters.

CIMA	DGFI	IBGE
		
Centro de Procesamiento Ingeniería Mendoza-Argentina, Universidad Nacional de Cuyo, Argentina. Southern network and selected sites of the middle network, 110 stations.	Deutsches Geodätisches Forschungsinstitut, Germany. Core network, 111 stations.	Instituto Brasileiro de Geografia e Estatística, Brazil. Middle network and selected sites of the southern network, 141 stations.
IGAC	IGM-Ec	LUZ
		
Instituto Geográfico Agustín Codazzi, Colombia. Northern network and selected sites of the middle network, 111 stations.	Instituto Geográfico Militar, Ecuador. Selected sites of the northern and middle networks, 74 stations.	Laboratorio de Geodesia Física y Satelital, Universidad del Zulia, Venezuela. Northern network and selected sites of the middle network, 111 stations.
SGM-Uy	INEGI	IGN-Ar
		
Servicio Geográfico Militar, Uruguay. Southern network and selected sites of the middle network, 74 stations.	Instituto Nacional de Estadística y Geografía, México. Selected sites of the northern network, 26 stations.	Instituto Geográfico Nacional, Argentina. Southern network, 60 stations.

In these solutions satellite orbits, satellite clock offsets, and Earth orientation parameters are fixed to the final weekly IGS solutions (Dow et al. 2009) and all station positions are loosely constrained with ± 1 m. The distribution of the SIRGAS-CON stations into the different clusters guarantees that each station is computed by three analysis centres.

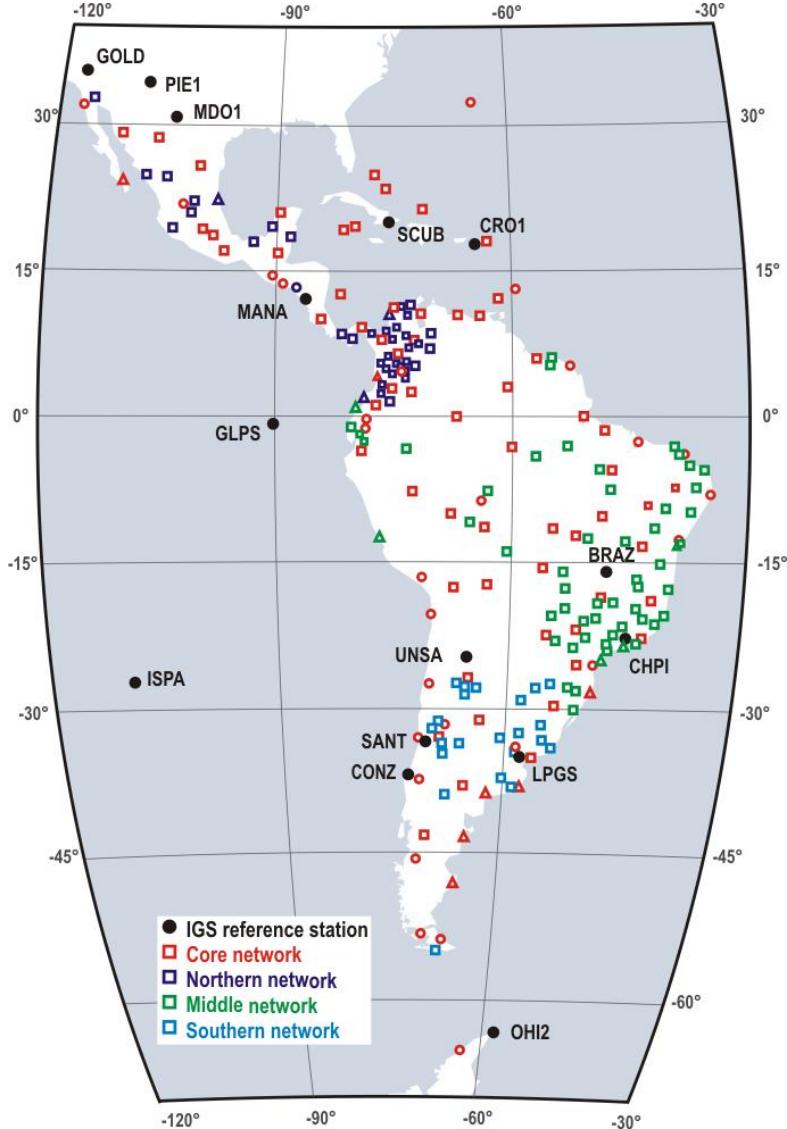

Figure 1. SIRGAS reference frame (status Sept. 2010)

The individual contributions are integrated in a combined solution by the SIRGAS combination centres DGFI and IBGE (Figure 2). The DGFI combinations are provided to the users as the SIRGAS final products (Sánchez et al. 2010a), while the IBGE combinations assure redundancy and control for those products (Costa et al. 2009). Before combining the individual solutions, the constraints included in the delivered normal equations are removed and the solutions are separately aligned to the ITRF to evaluate their quality and in order to identify possible outliers. If it is necessary to compensate differences in the stochastic models of the processing centres, variance (scaling) factors are determined from the standard deviations obtained after solving the individual normal equations with respect to the ITRF (Sánchez et al. 2008). Once inconsistencies and outliers are reduced from the individual free normal equations, a combination for a loosely

constrained weekly solution for station positions (all of them constrained with ± 1 m) is computed. This solution is submitted in SINEX format (http://www.iers.org/IERS/EN/Organization/AnalysisCoordinator/SinexFormat/sinex_cont.html) to the IGS for the global polyhedron (<http://igscb.jpl.nasa.gov/organization/acccharter.html>) and it is stored to be included in the next multi-year solution of the SIRGAS-CON network. A solution aligned to the IGS reference frame (used for the GPS orbit determination) is also computed to provide weekly positions of all SIRGAS-CON stations (Annex 2). At present, the IGS reference frame is the IGS05 (<http://igscb.jpl.nasa.gov/network/refframe.html>). Once the IGS applies the new ITRF2008 (http://itrf.ensg.ign.fr/ITRF_solutions/2008/) for generating its products, the SIRGAS-CON weekly station positions will also refer to it.

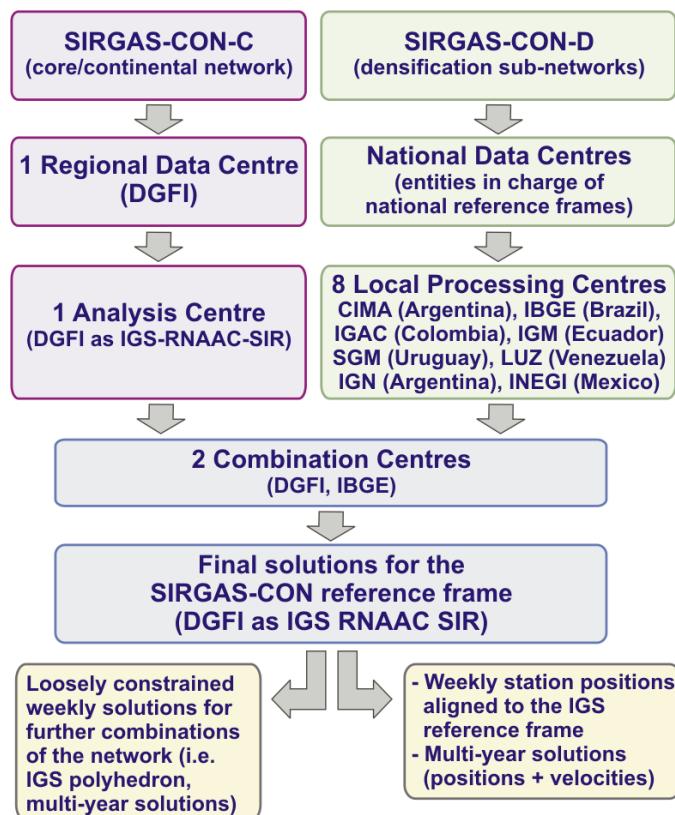

Figure 2. Data flow in the analysis of the SIRGAS reference frame

This operational infrastructure is possible since August 2008 thanks to the active participation of many Latin American and Caribbean institutions, who not only make available the measurements of their stations, but also are operating SIRGAS analysis centres in charge of computing the observational data on a routine basis. Before August 2008, the SIRGAS-CON network was entirely processed in only one block by the DGFI.

3. Input data for the multi-year solution SIR10P01

The input data for the generation of the multi-year solution SIR10P01 are the loosely constrained weekly solutions of the SIRGAS-CON network between January 2, 2000 and June 5, 2010. As already mentioned, these weekly solutions were computed by DGFI in only one adjustment for the entire network containing data up to August 31, 2008 (GPS

week 1495). The loosely constrained weekly solutions for the later weeks are the combined solutions of the different clusters processed by the SIRGAS analysis centres.

Weekly solutions from January 2000 (GPS week 1043) to November 2006 (1399) formerly computed with relative antenna phase centre corrections and referring to previous ITRF solutions have been reprocessed based on absolute phase centre corrections provided by the IGS (model igs05_1525.atx, see: http://igscb.jpl.nasa.gov/igscb/station/general/pcv_archive/) and the IGS05 as reference frame (see strategy in Annex 1). This reprocessing provides homogeneously computed weekly solutions for the complete time span covered by the SIR10P01 solution and allows to improve reliability and accuracy of station positions and velocities. Figure 3 shows timetable and infrastructure used for processing and reprocessing the loosely constrained weekly solutions included in SIR10P01. Reprocessed solutions are identified with the name SI1 $wwww$ to be distinguished from the old weekly solutions.

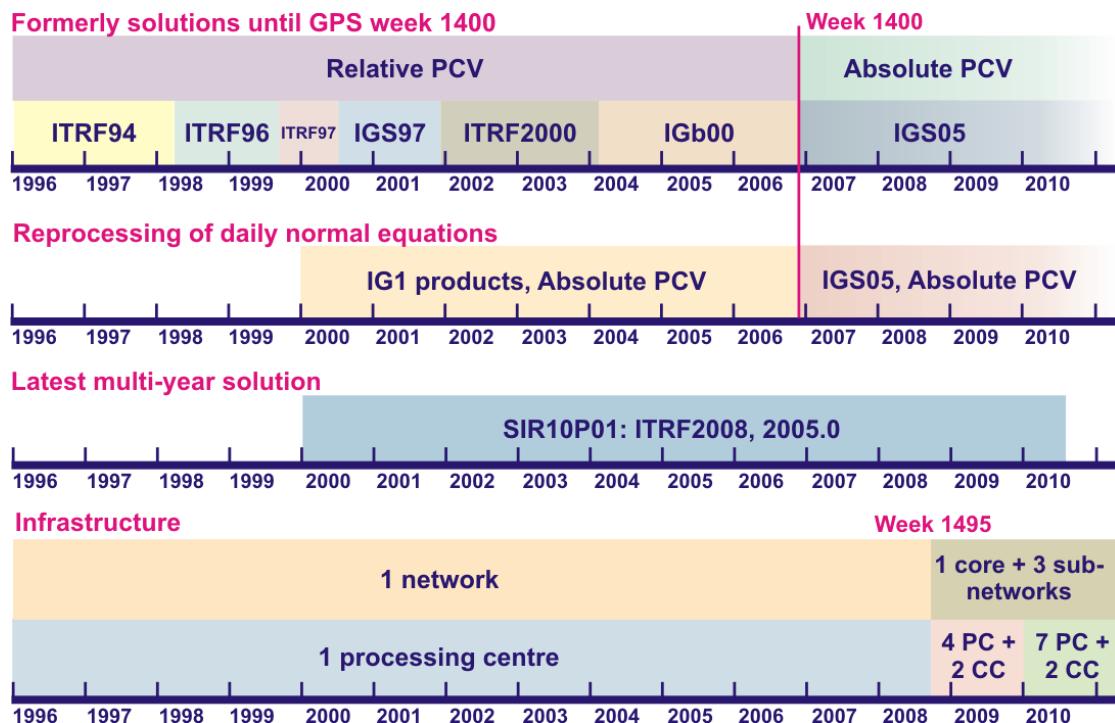

Figure 3. Timetable and infrastructure applied for processing and reprocessing the weekly solutions included in the multi-year solution SIR10P01.

4. Processing strategy

The processing strategy for the SIRGAS reference frame SIR10P01 is given as a flow chart in Figure 4. It is realized using the Bernese GPS Software V5.0 (Dach et al. 2007).

The main parts of the analysis are:

- 1) Computation of time series and time series analysis to identify outliers and discontinuities in station positions (see grey arrows in Figure 4);
- 2) Combination of weekly normal equations (NEQ) to compute the SIRGAS reference frame (see blue arrows in Figure 4).

Before starting with the computation preparative steps are necessary. Unconstrained (free) normal equations are reconstructed from the weekly solutions stored in SINEX format. Thereby, the station information, e.g. antenna and receiver types, is compared to the log files and corrected if necessary in order to guarantee consistency of the station information. So, the input data for computation are unconstrained (non-deformed) normal equations and correct station information.

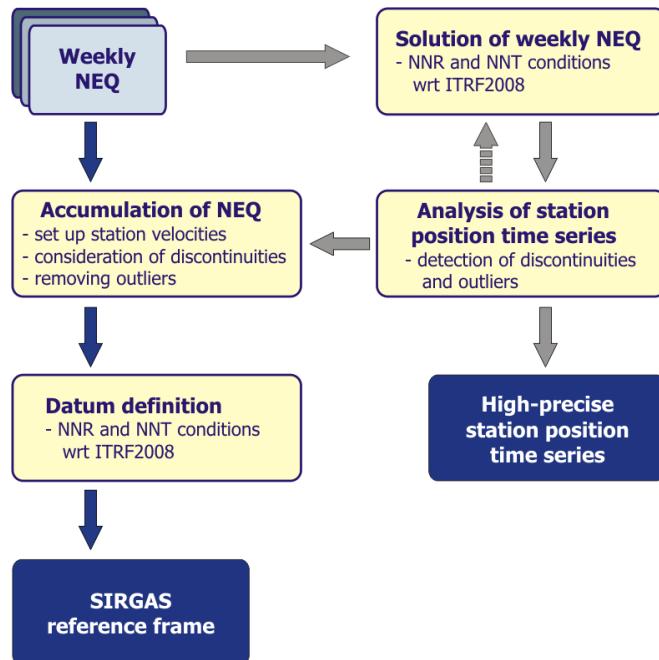

Figure 4. Processing strategy for the computation of the SIRGAS reference frame.

4.1 Computation of time series and time series analysis

The weekly normal equations are solved separately applying no-net-rotation (NNR) and no-net-translation (NNT) conditions with respect to ITRF2008. To generate residual position time series, the weekly solutions are transformed to an a priori SIRGAS reference frame (i.e. the actual SIRGAS reference frame SIR09P01, Seemüller et al. 2009) by a 7-parameter similarity transformation. The residual time series of station positions (Annex 4) are analysed and the detected discontinuities and outliers are taken into account for the computation of the SIRGAS reference frame (see section 4.2).

The chosen thresholds for outliers are 15 mm for north and east and 30 mm in height (about fourfold the mean RMS). If outliers appear sporadically (without pattern), the station is reduced from the normal equation for the corresponding week. If outliers correspond to a discontinuity, a new position is set up for the station. According to these criteria, discontinuities for 20 stations were identified (Table 3). Changes caused by the recent earthquakes in Chile (Figure 5) and Baja California, Mexico (Figure 6) were excluded, i.e. SIRGAS-CON stations moved by these two events were reduced from the weekly normal equations after GPS weeks 1572 and 1578, respectively. To determine the long-term effect of these earthquakes on the reference frame, it is necessary to analyse cumulative solutions of more than two years after their occurrence.

4.2 Combination of weekly normal equations

According to Figure 4, the weekly normal equations are combined to a multi-year solution setting up station velocities. Seasonal (e.g. loading) signals are not considered up to now. In this way, stations with observation time spans of less than 2 years of data are excluded (reduced) as the velocity estimation would be strongly affected by seasonal variations. The geodetic datum is realized by applying no-net-rotation and no-net-translation conditions with respect to the ITRF2008 using a set of reliable stations for datum realisation (Figure 7). After solving the first SIRGAS reference frame, step (1) and (2) are iterated: new station position residual time series are generated by transforming the weekly solutions to the computed SIRGAS reference frame. Discontinuity and outlier detection are repeated and the new information is introduced into the computation of a refined reference frame. The final solution refers to the same epoch as the ITRF2008, i.e. 2005.0.

Table 3. Discontinuities identified in the computation of SIR10P01.

5. Results

The final coordinates and velocities (Annex 3, Figures 7 and 8) contained in the multi-year solution SIR10P01 refer to the ITRF2008, epoch 2005.0. It includes 183 stations with 204 occupations (due to the discontinuities summarized in Table 3). It is well known, that the formal errors (included in the SINEX file) estimated in the GPS observation analysis are too small because physical correlations between the GPS observations are not well known and thus not considered. Therefore, standard deviations for station positions and velocities are derived from the residual position time series. According to this, the precision of coordinates at reference epoch is estimated to be $\sim \pm 0,5$ mm in the horizontal component and $\sim \pm 0,9$ mm in the height. The precision of horizontal and vertical velocities is about $\pm 0,2$ mm/a and $\pm 0,4$ mm/a, respectively. Table 5 shows the position and velocity deviations of the SIR10P01 solution with respect to the ITRF2008.

The SIR10P01 solution (coordinates, velocities, and SINEX file) is available at www.sirgas.org. Please note that the reference epoch in the SINEX file is the epoch of the first included GPS observation. Additionally, as mentioned above, the standard deviations included in the SINEX file are not reliable. Realistic precision estimations are included together with the coordinates in Annex 3, as well as in the SIRGAS web site.

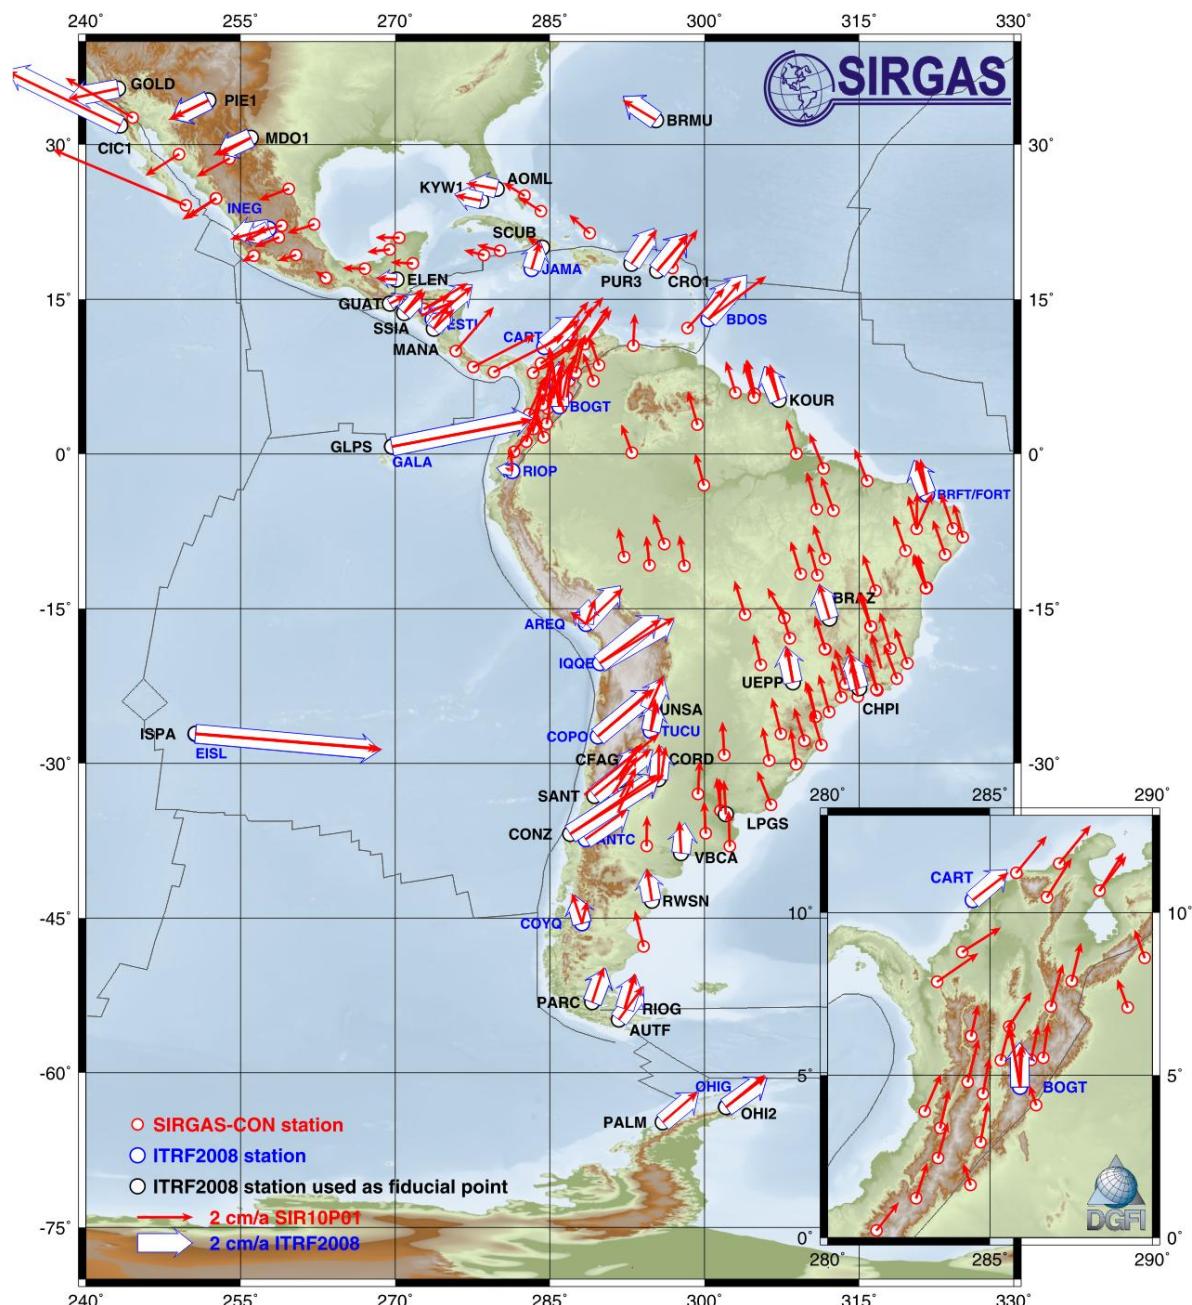

Figure 7. Horizontal velocities of the SIR10P01 multi-year solution.
Velocities of ITRF2008 stations are included for comparison.

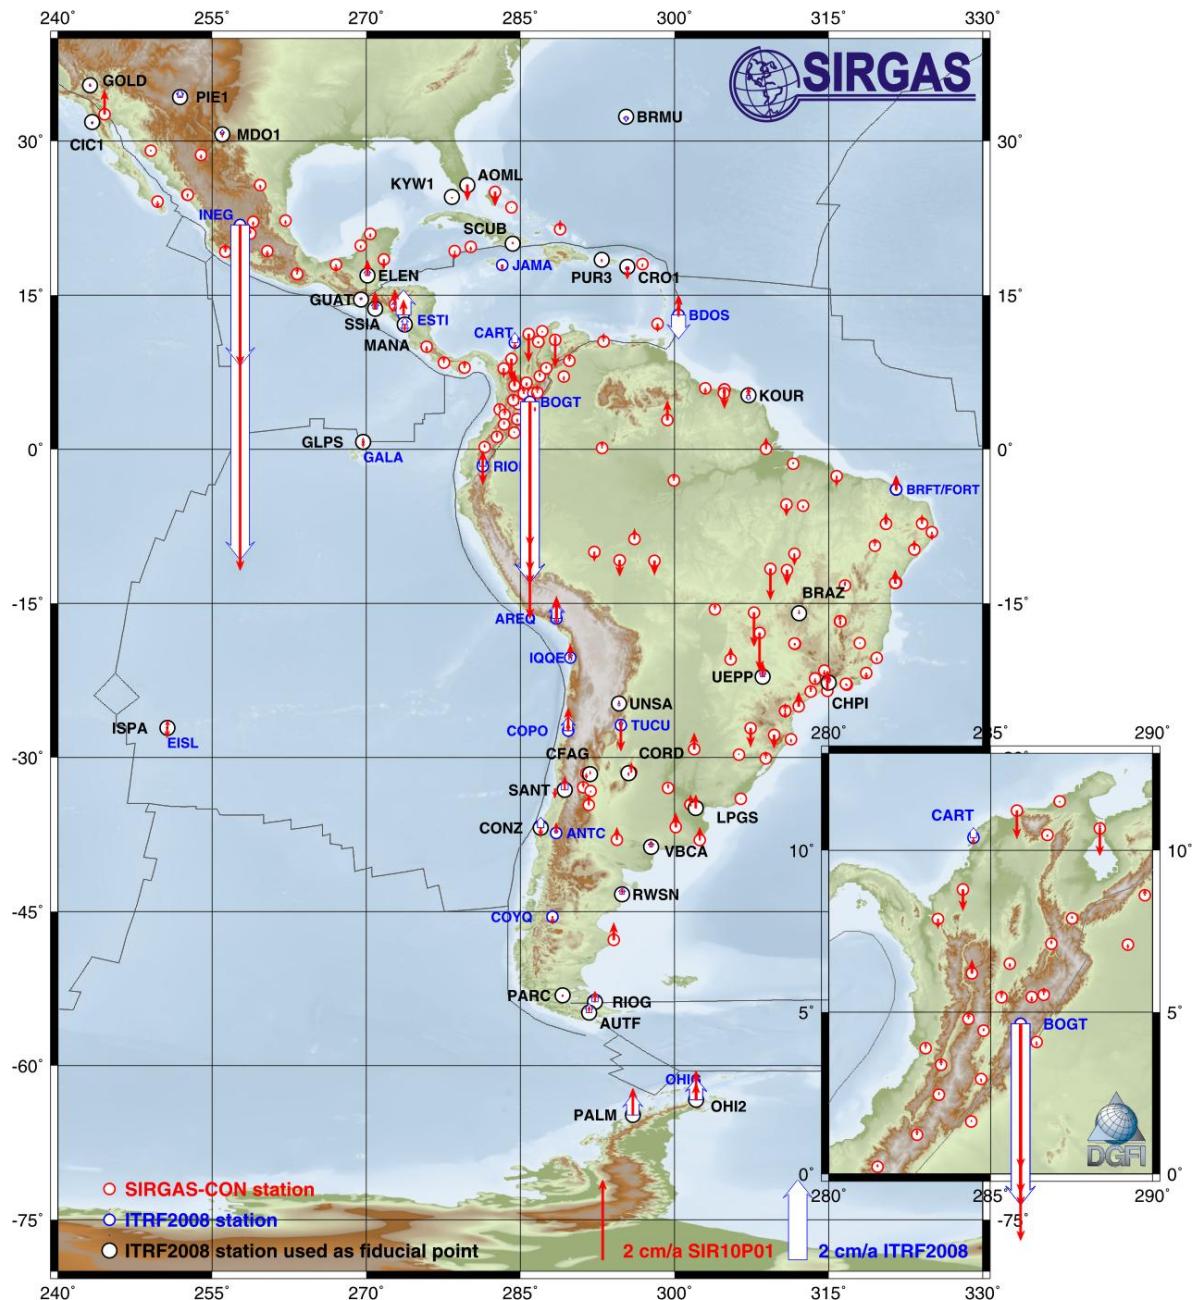

Figure 8. Vertical velocities of the SIR10P01 multi-year solution.
Velocities of ITRF2008 stations are included for comparison.

6. Sustainability of the SIRGAS reference frame

The former SIRGAS realisations (SIRGAS95 and SIRGAS2000) as well as the multi-year solutions of the SIRGAS-CON network include those models, standards, and strategies widely applied at the time in which they were computed; e.g. different ITRF solutions, ocean tide loading, a priori ionosphere models for ambiguity resolution, relative corrections for the phase centre variations until 2006 and absolute corrections afterwards, etc. In order to evaluate the sustainability of the SIRGAS realisations, the following steps are carried out (Sánchez et al. 2010b):

- 1) The SIRGAS95 and SIRGAS2000 realisations are compared with the latest SIRGAS-CON multi-year solution (SIR10P01). This comparison is done in the ITRF2008 reference frame and at the conventional epochs of the former realisations, i.e. 1995.4 and 2000.4
- 2) The different SIRGAS multi-year solutions are compared with the latest ITRF solution (ITRF2008). For this purpose, the multi-year solutions are transformed to ITRF2008 and the coordinate comparison is done for epoch 2000.0. Transformation parameters given in <http://itrf.ensg.ign.fr/> are applied.

In all cases, stations affected by earthquakes are excluded.

Results (Tables 4 and 5) show a very good consistency between the different SIRGAS realisations. The largest discrepancies (~ 2 cm) were detected for the SIRGAS realisations referring to ITRF94 and ITRF97. Realisations referring to ITRF2000 and IGS05 have an agreement better than ± 5 mm. This reflects the expected improvement of the reference frame as consequence of longer time series of station positions and the better new models, standards, and analysis strategies applied today.

Although the reliability of the estimated positions and velocities of the SIRGAS reference stations as well as its compatibility through time are demonstrated, it is necessary to give special care to the reference frame deformations caused by seismic events. This implies the permanent monitoring of the (continental and national) reference networks by means of continuously operating GNSS stations and the consequent modelling of the deformations caused by this kind of events (Sánchez et al. 2010b).

Table 4. Comparison of SIRGAS95 and SIRGAS2000 with the multi-year solution SIR10P01

Comparison with SIR10P01					
Realization	Common stations	Position deviations: Offsets \pm RMS			
		N[mm]	E[mm]	h[mm]	
SIRGAS95	19	-21,3 \pm 4,9	-18,7 \pm 4,2	5,8 \pm 18,3	
SIRGAS2000	53	-0,3 \pm 8,6	0,1 \pm 7,5	-6,2 \pm 10,3	

Table 5. Comparison of the different SIRGAS-CON multi-year solutions with the ITRF2008

Solution	Comparison with the ITRF2008						
	Common stations with ITRF2008	Position deviations: Offsets \pm RMS			Velocity deviations: Offsets \pm RMS

Annex 1: Procedure to generate loosely constrained weekly solutions for the SIRGAS-CON sub-networks

- 1) Elevation mask and data sampling rate are set to 3° and 30 s, respectively;
- 2) Absolute calibration values for the antenna phase centre corrections published by the IGS are applied;
- 3) Satellite orbits, satellite clock offsets, and Earth orientation parameters are fixed to the combined IGS weekly solutions;
- 4) The quasi ionosphere free (QIF) strategy is applied for solving the L1 and L2 phase ambiguities;
- 5) Periodic site movements due to ocean tide loading are modelled according to the FES2004 ocean tide model (Letellier 2004). The corresponding values are provided by M.S. Bos and H.-G. Scherneck at <http://129.16.208.24/loading/>;
- 6) Zenith delay due to the tropospheric refraction (~ wet part) is estimated at a 2 hours interval within the network adjustment and it is mapped using the Niell (1996) wet mapping function. The a priori zenith delay (~ dry part) is modelled using the Saastamoinen model (1973) and it is mapped with the Niell (1996) dry mapping function;
- 7) Daily free normal equations are computed and combined to get a loosely constrained weekly solution for station coordinates (all station coordinates are loosely constrained with $\square 1$ m);
- 8) Stations with large residuals in the weekly combination (more than 20 mm in the N and E components, and more than 30 mm in the height) are reduced from the normal equations. Steps (7) and (8) are iterative;
- 9) These loosely constrained solutions in SINEX format are identified with the name CCCwww7.SNX, CCC identifies the corresponding processing centre (i.e. CIM, DGF, ECU, GNA, IBG, IGA, INE, LUZ, URY), www stands for the GPS week, and 7 for including the seven days of the week. The individual solutions delivered by the SIRGAS processing centres are available at <ftp.sirgas.org/pub/gps/SIRGAS/>.

Annex 2: Procedure to combine the loosely constrained weekly solutions for the SIRGAS-CON sub-networks

The SIRGAS processing centres deliver loosely constrained weekly solutions for the assigned SIRGAS-CON clusters. In these solutions, satellite orbits, satellite clock offsets, and Earth orientation parameters are fixed to the final weekly IGS values and coordinates for all sites are loosely constrained with ± 1 m. These individual contributions are integrated in a combined solution by the SIRGAS combination centres: DGFI and IBGE. The processing strategy applied by DGFI for the combination of the individual SIRGAS-CON clusters applies the Bernese Software V.5.0 (Dach et al. 2007) and corresponds to (Sánchez et al. 2008, Sánchez et al. 2010a):

- 1) Individual solutions are reviewed/corrected for possible format problems, station inconsistencies, utilization of erroneous equipment, etc.;
- 2) Constraints included in the delivered normal equations are removed;
- 3) Individual normal equations are separately solved with respect to the same IGS stations used for the GPS orbit computation (the so-called IGS reference frame). In this case, the IGS reference station positions are constrained to the IGS weekly coordinates (igsyyP www .snx, for reprocessed products the prefix ig1 is used). At present, the IGS05 reference frame is applied. Once the IGS had included the new ITRF2008 as reference frame, we will use it, too.
- 4) Coordinates obtained in (3) for each processing centre are compared to the IGS weekly values and to each other to identify possible outliers;
- 5) Stations with large residuals (more than 10 mm in the north or east components, and more than 20 mm in the height) are reduced from the normal equations. Steps (3), (4), and (5) are iterative;
- 6) Variances obtained in the final computation of step (3) are analysed to estimate variance scaling factors for relative weighting of the individual solutions;
- 7) Once inconsistencies and outliers are reduced from the individual free normal equations, a combination for a loosely constrained weekly solution for station coordinates (all station coordinates constrained with ± 1 m) is computed. This solution is submitted to IGS for the global polyhedron and stored to be included in the next multi-year solution of the SIRGAS reference frame;
- 8) Additionally, a weekly solution aligned to the ITRF is computed. As in step (3), the geodetic datum is defined by constraining the coordinates of the IGS reference stations to their positions calculated within the IGS weekly combinations (igsyyP www .snx). The applied constraints guarantee that the coordinates of the IGS reference stations do not change more than 1,5 mm within the SIRGAS-CON adjustment;
- 9) Resulting files of these procedure are:
 - SIR www 7.SNX: SINEX file for the loosely constrained weekly combination.
 - SIR www 7.SUM: Report of weekly combination.
 - siryyP www .snx: SINEX file for the constrained weekly combination.
 - siryyP www .crd: Final SIRGAS-CON coordinates for week www .
 - For reprocessed solutions the prefix SI1 is used.
- 10) The loosely constrained combinations as well as the weekly SIRGAS-CON coordinates are available at ftp.sirgas.org/pub/gps/SIRGAS/ or at www.sirgas.org.

Annex 3: Station positions and velocities of the SIR10P01 multi-year solution.

Geocentric Cartesian coordinates [X, Y, Z] are converted to ellipsoidal coordinates [φ , λ , h] using the GRS80 ellipsoid.

Annex 4: Time series of station positions

The time series of the station coordinates for the time span covered by the SIR10P01 solution (i.e. January 2, 2000 till June 5, 2010) are presented in the following. Coordinate variations are given in centimetres and they are plotted on a weekly basis.

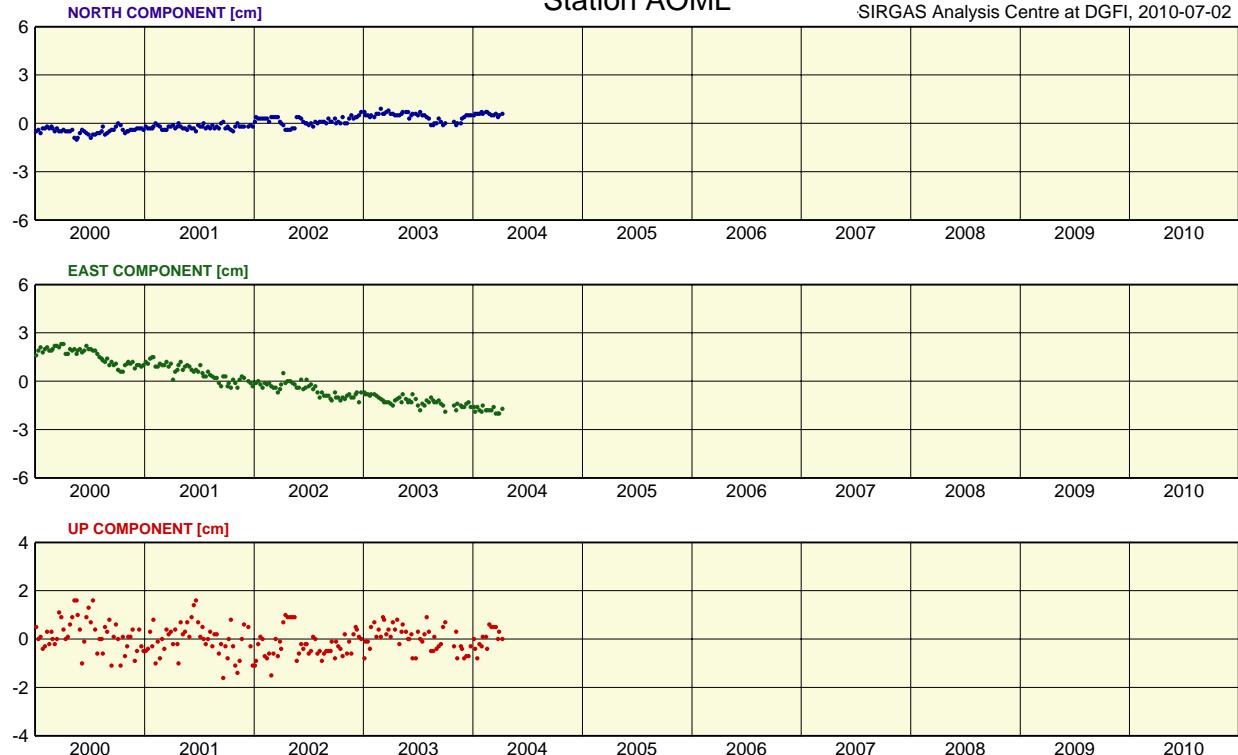

Station APTO

SIRGAS Analysis Centre at DGFI, 2010-07-02

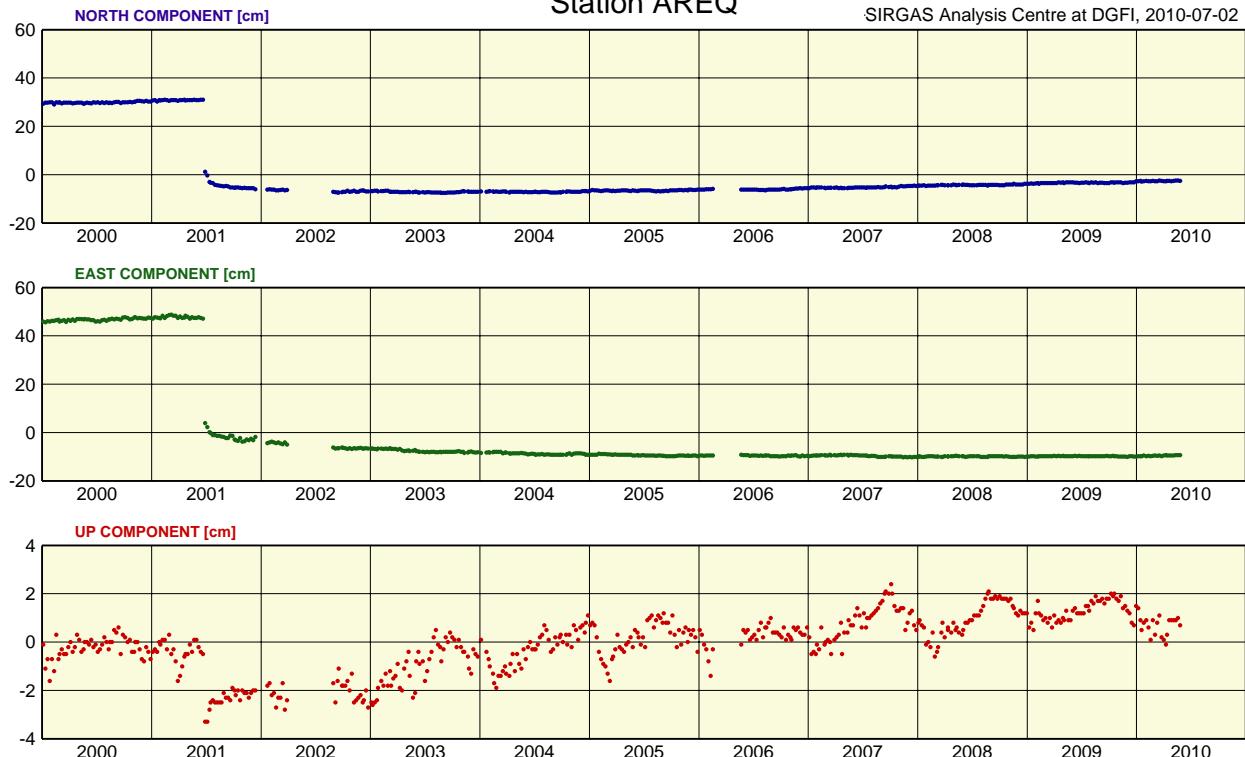

Station AOML

SIRGAS Analysis Centre at DGFI, 2010-07-02

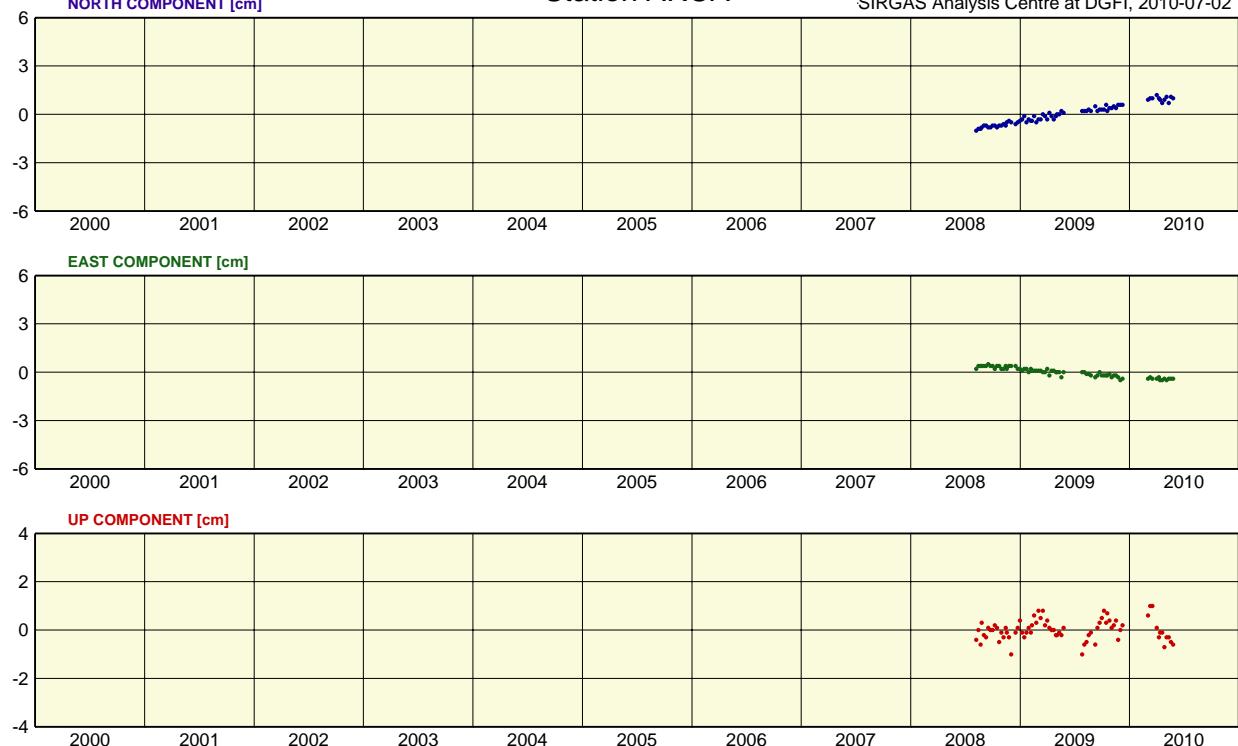

Station AREQ

SIRGAS Analysis Centre at DGFI, 2010-07-02

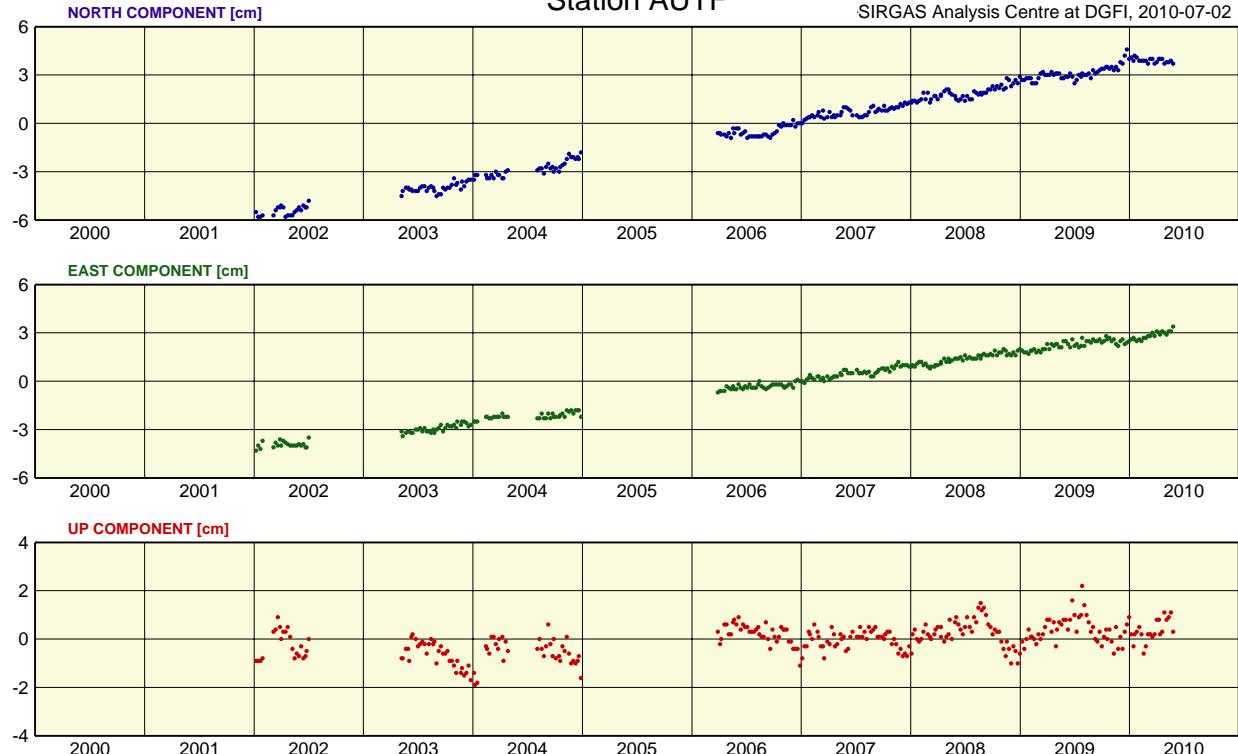

Station ARCA

SIRGAS Analysis Centre at DGFI, 2010-07-02

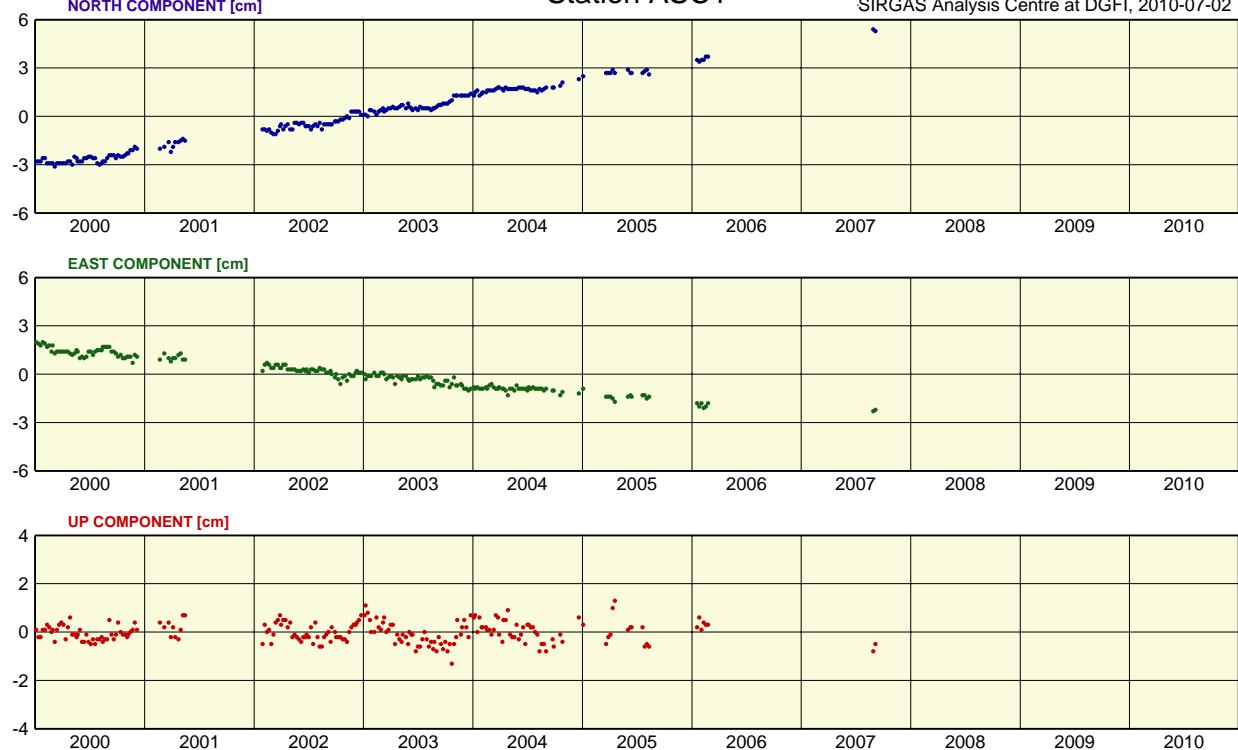

Station AUTF

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station ASC1

SIRGAS Analysis Centre at DGFI, 2010-07-02

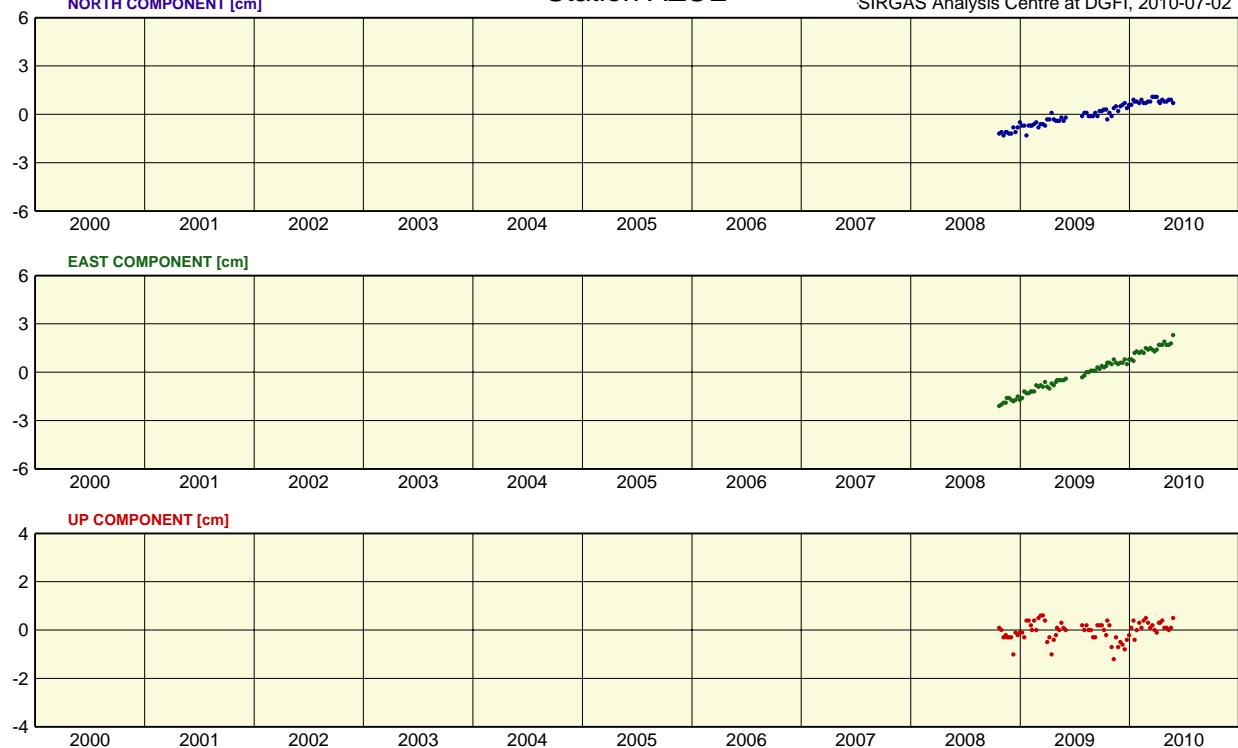

Station AZUL

SIRGAS Analysis Centre at DGFI, 2010-07-02

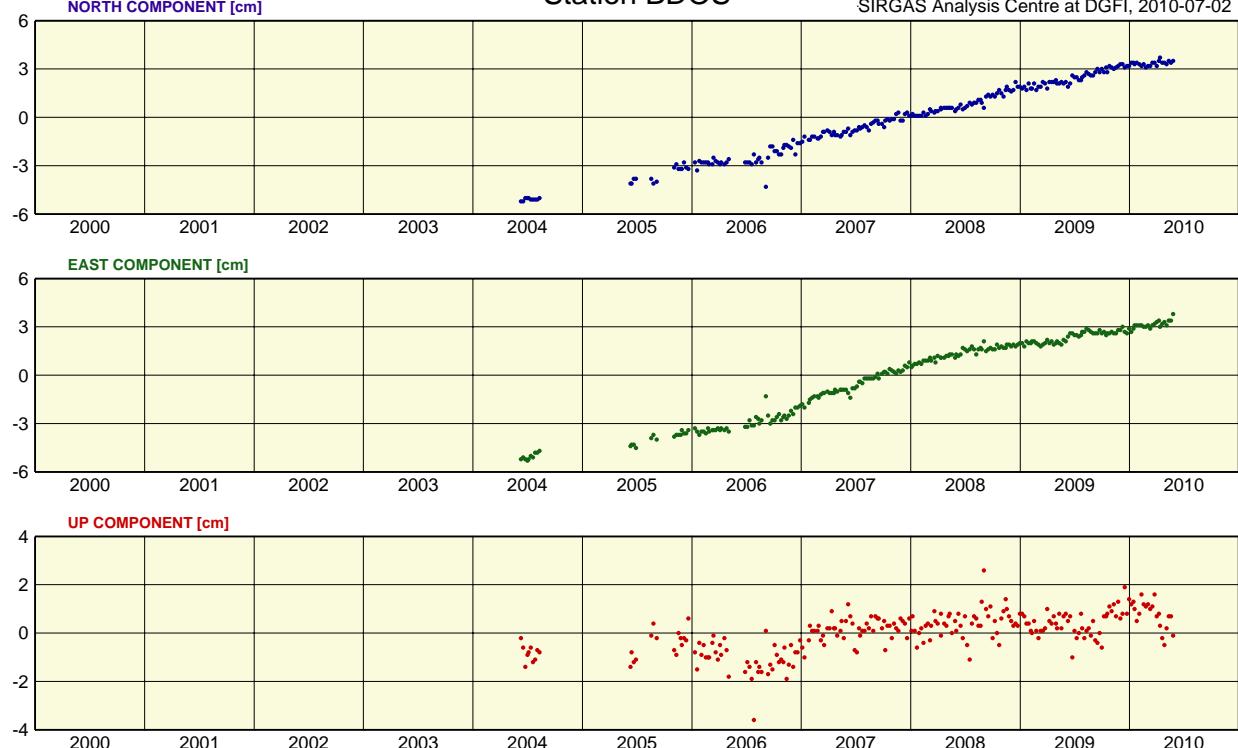

Station AZUE

SIRGAS Analysis Centre at DGFI, 2010-07-02

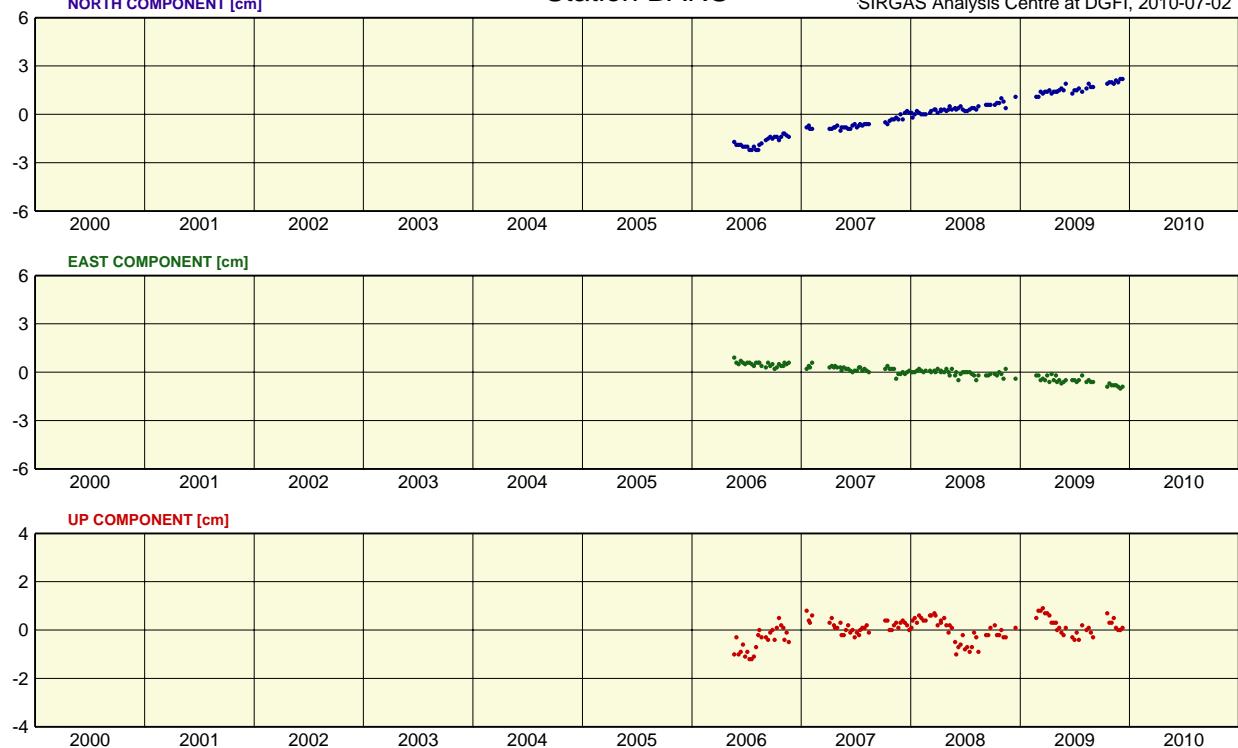

Station BDOS

SIRGAS Analysis Centre at DGFI, 2010-07-02

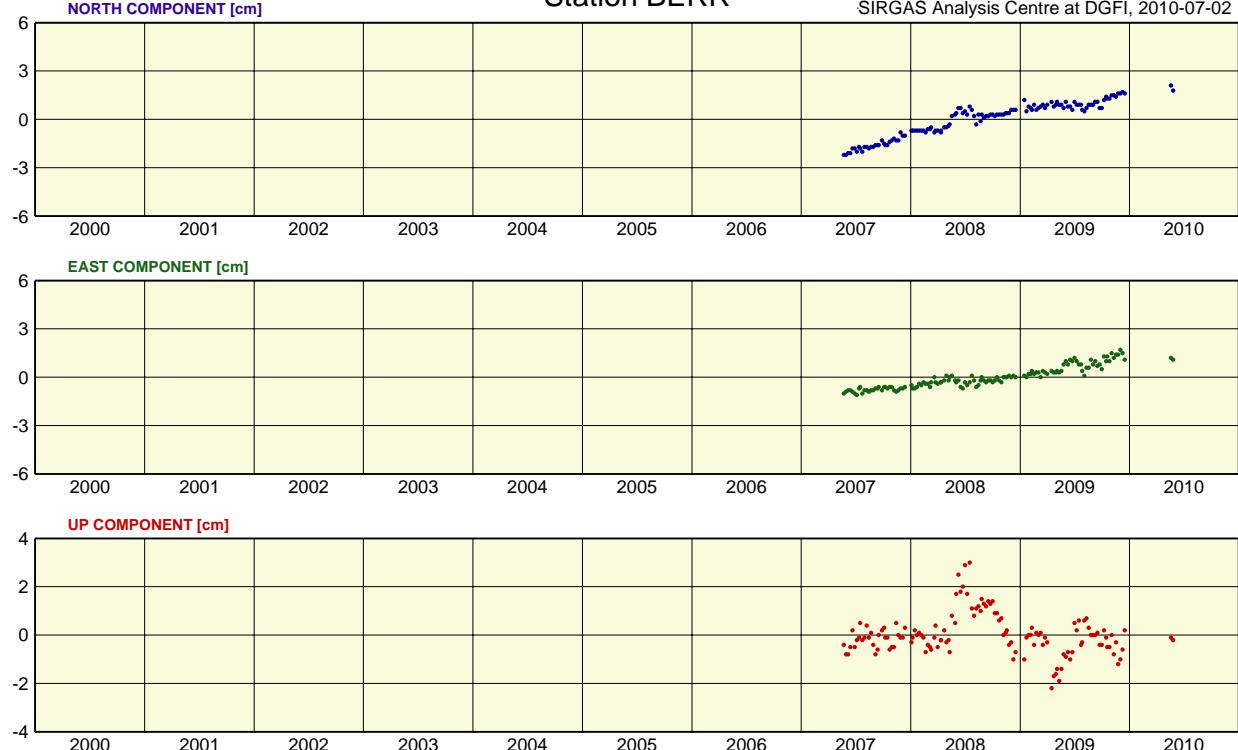

Station BANS

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station BERR

SIRGAS Analysis Centre at DGFI, 2010-07-02

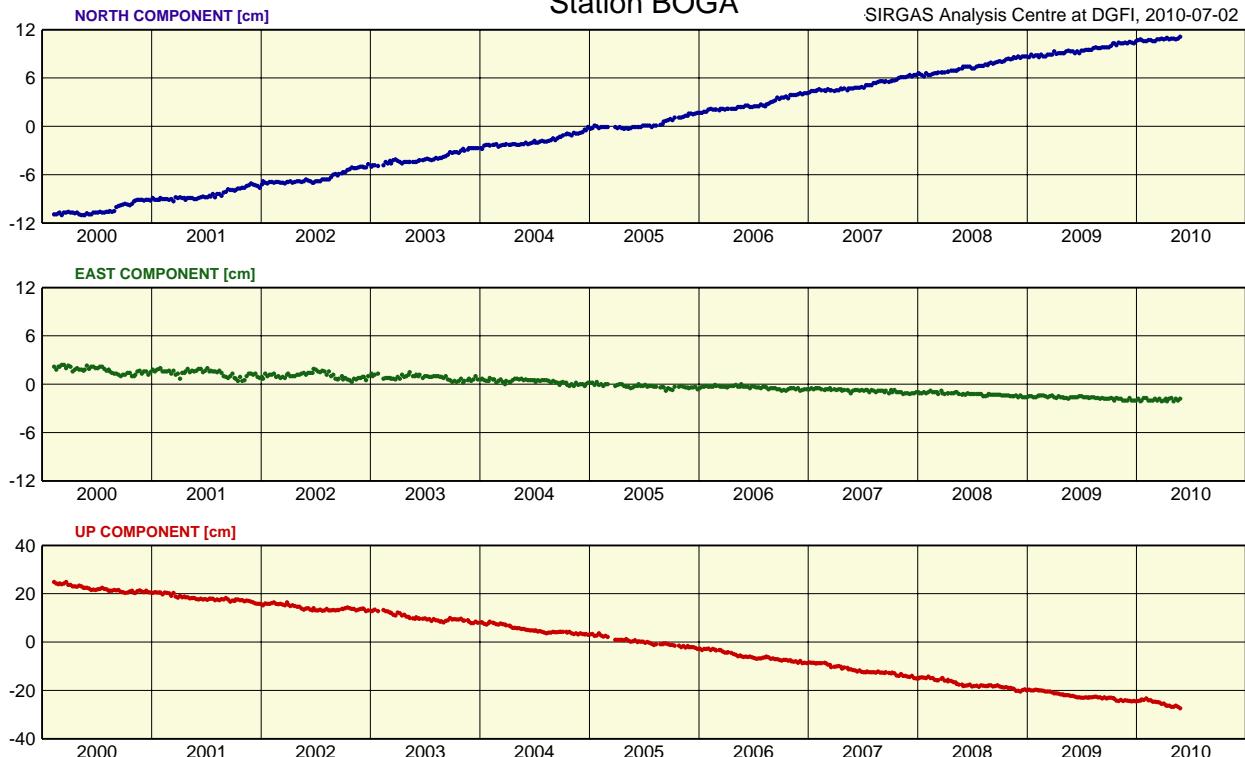

Station BELE

SIRGAS Analysis Centre at DGFI, 2010-07-02

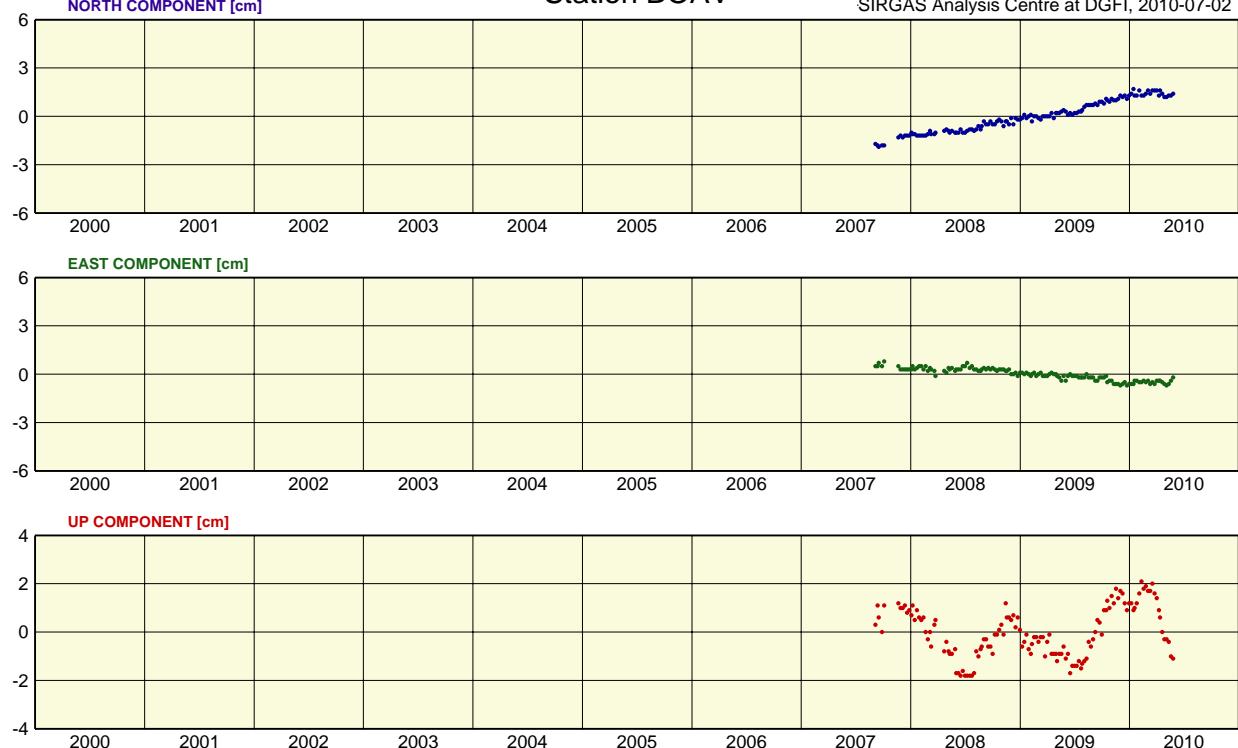

Station BOGA

SIRGAS Analysis Centre at DGFI, 2010-07-02

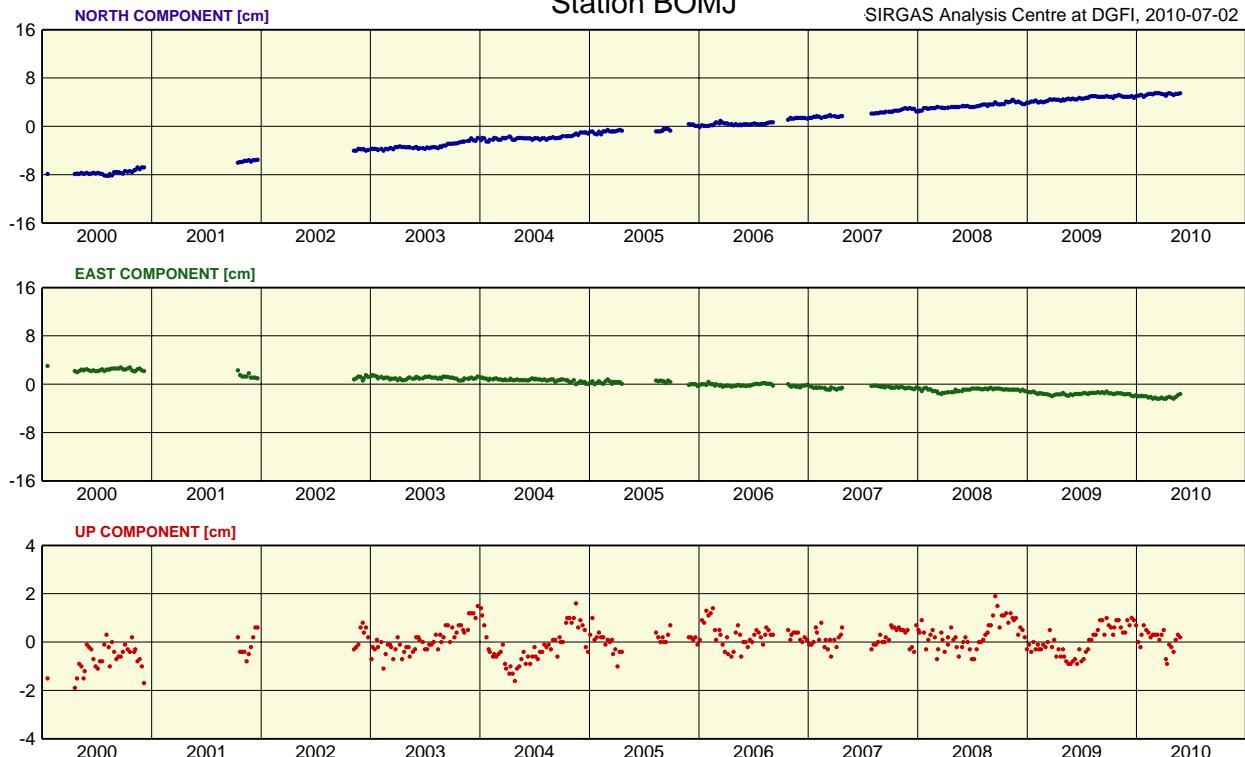

Station BOAV

SIRGAS Analysis Centre at DGFI, 2010-07-02

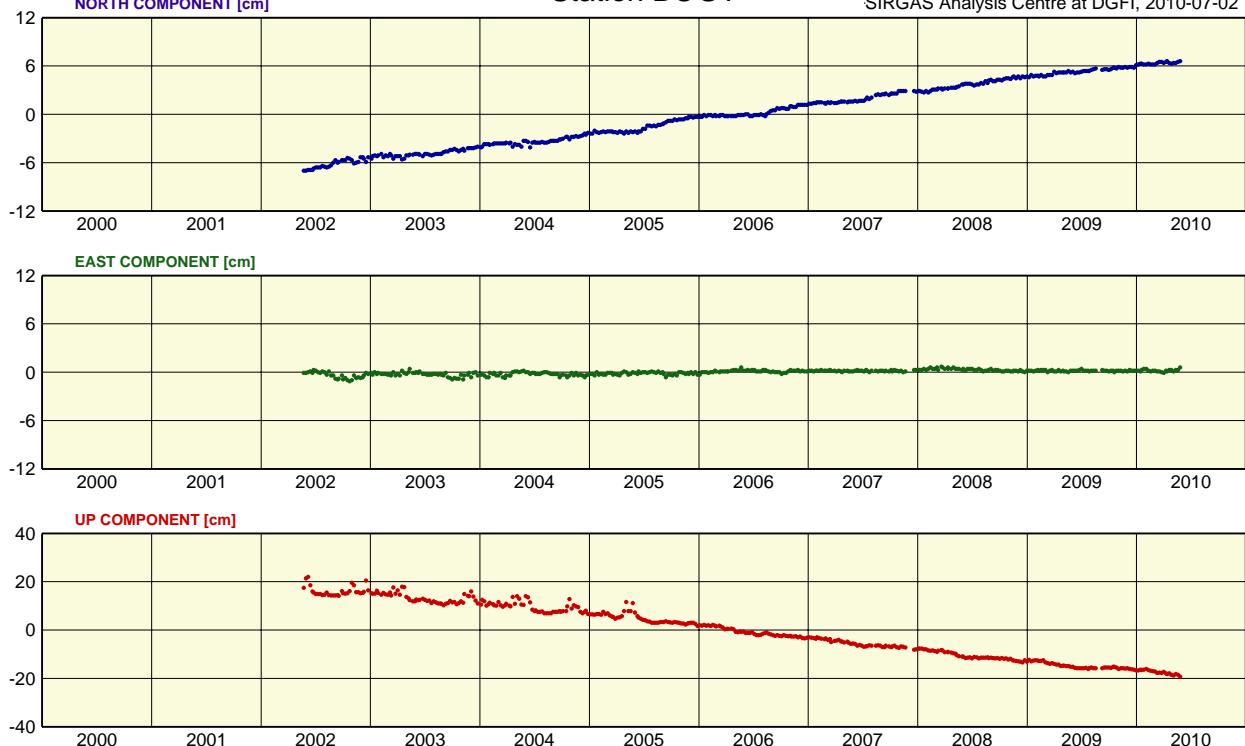

Station BOMJ

SIRGAS Analysis Centre at DGFI, 2010-07-02

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station LPGS

SIRGAS Analysis Centre at DGFI, 2010-07-02

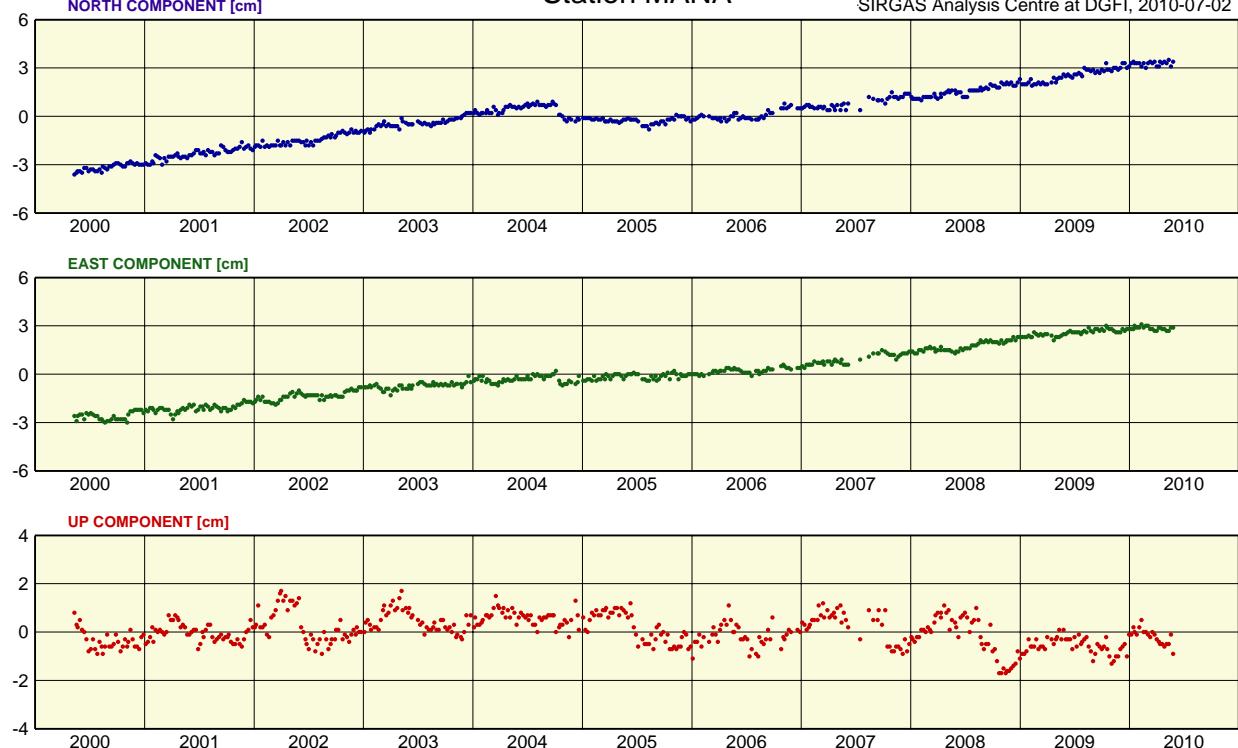

Station MAPA

SIRGAS Analysis Centre at DGFI, 2010-07-02

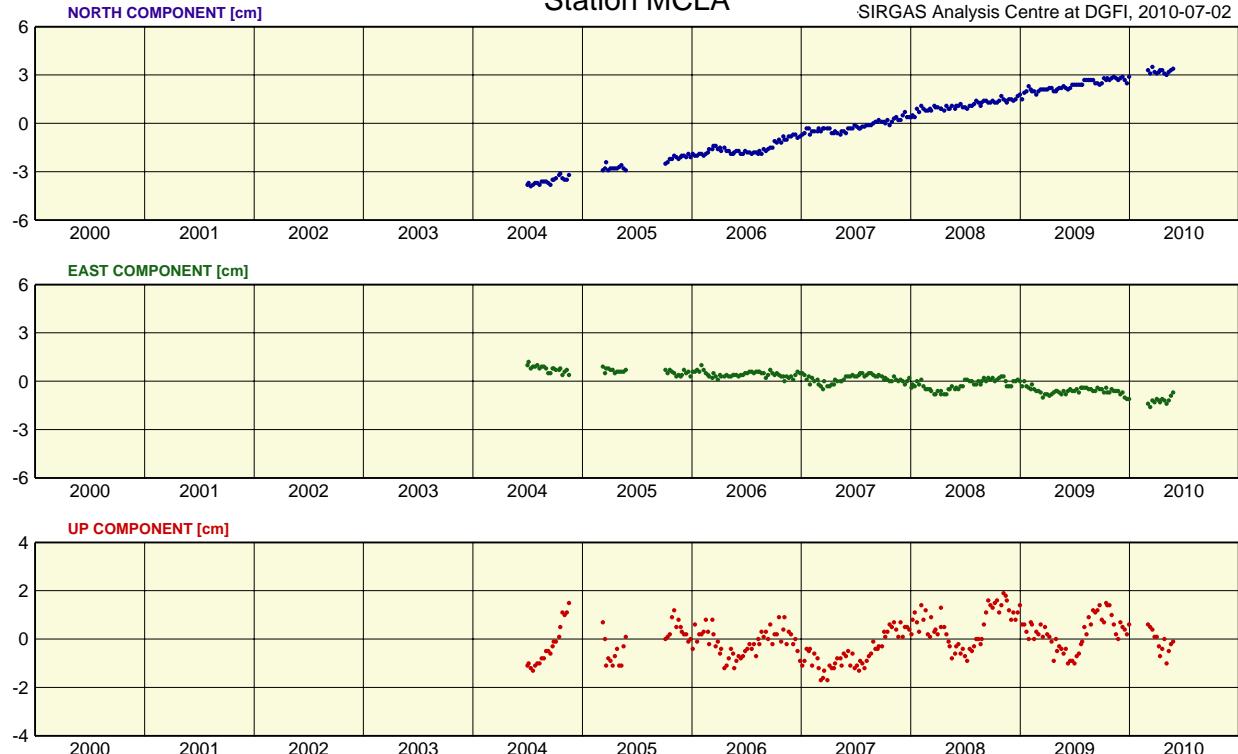

Station MANA

SIRGAS Analysis Centre at DGFI, 2010-07-02

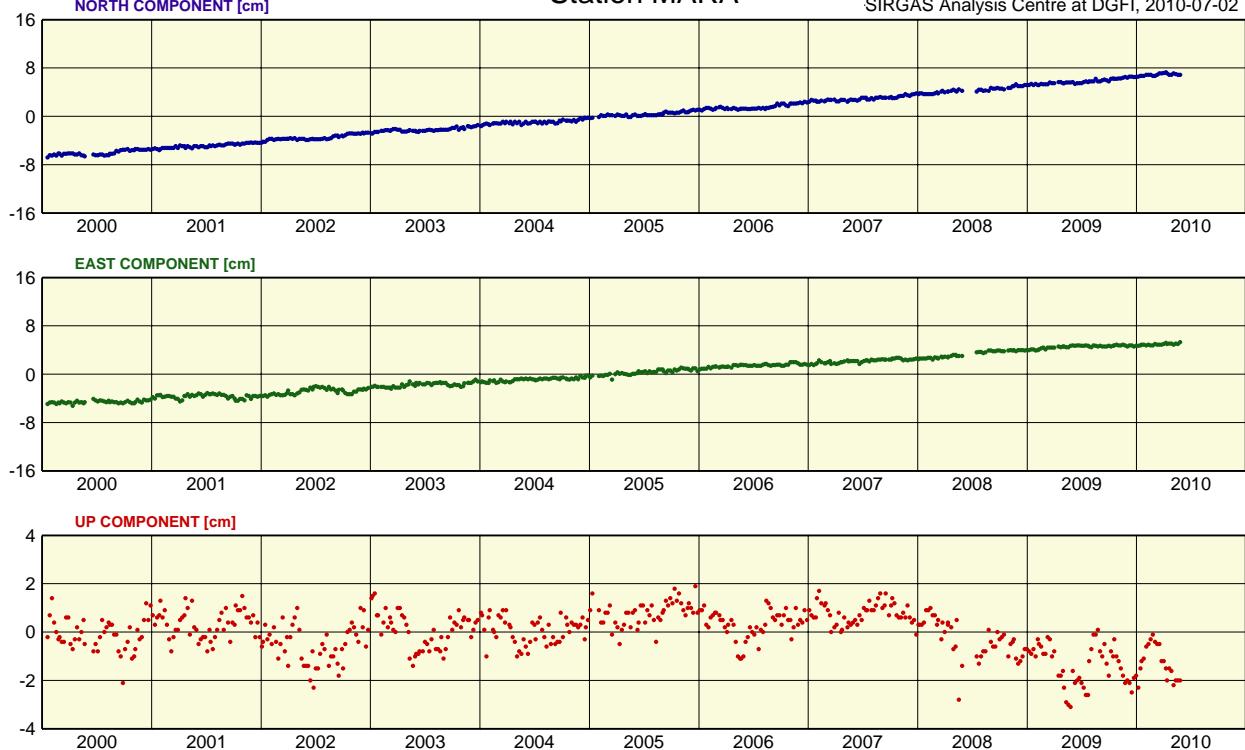

Station MCLA

SIRGAS Analysis Centre at DGFI, 2010-07-02

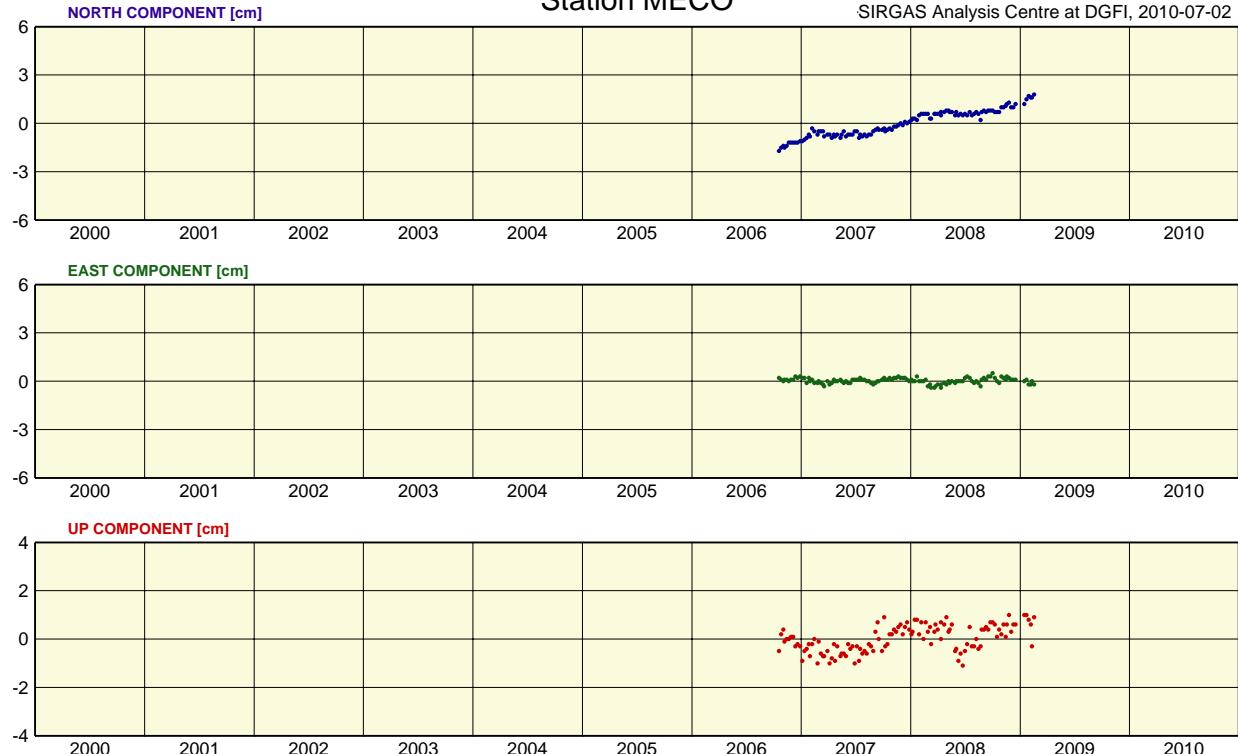

Station MARA

SIRGAS Analysis Centre at DGFI, 2010-07-02

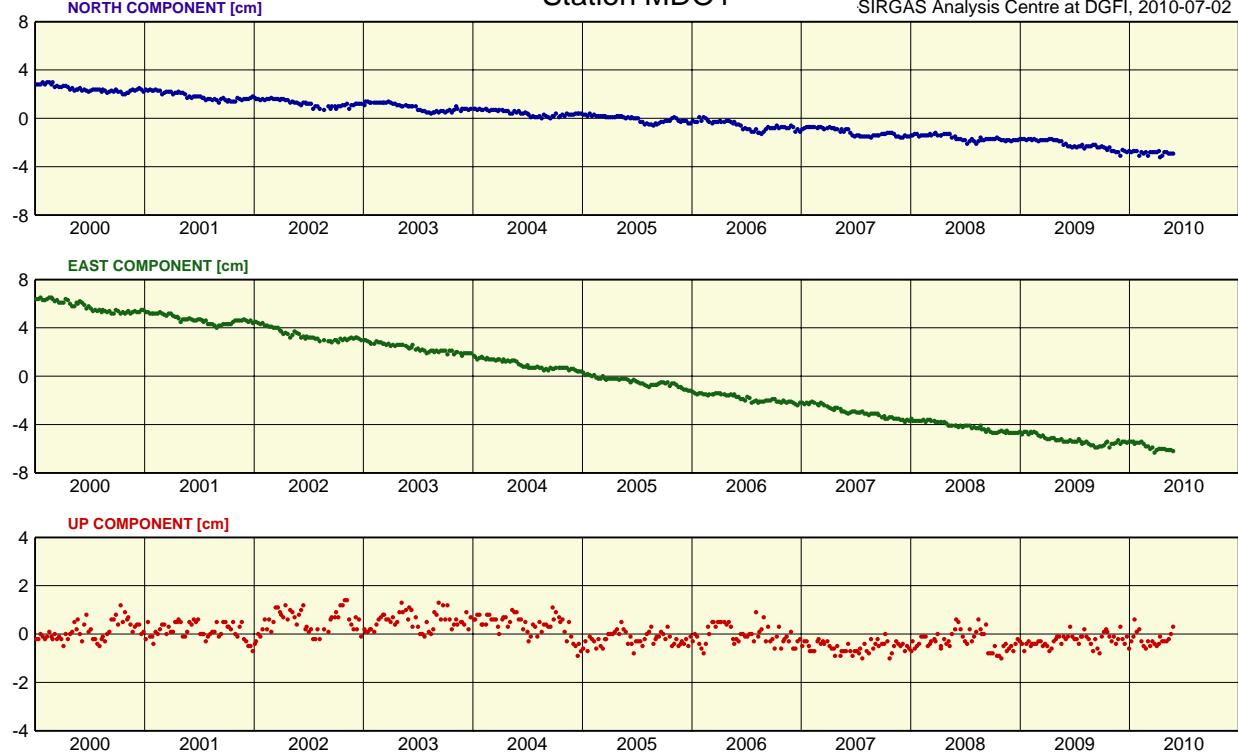

Station MECO

SIRGAS Analysis Centre at DGFI, 2010-07-02

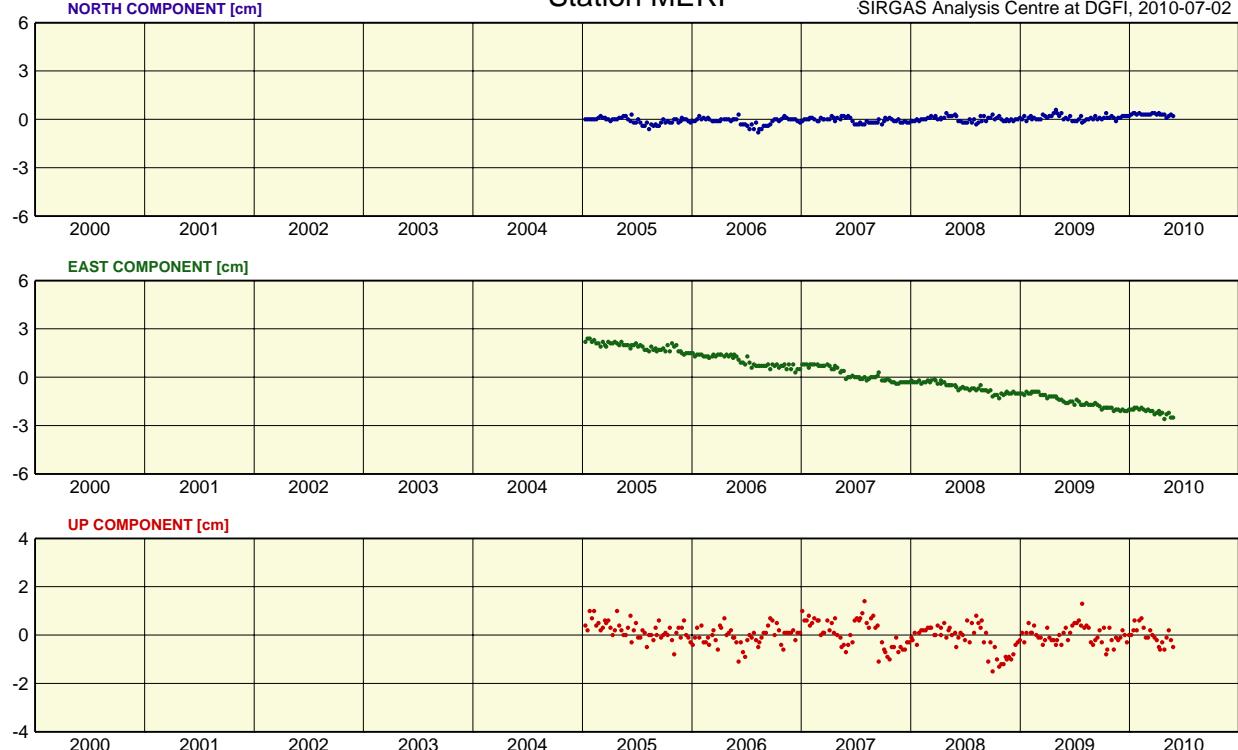

Station MDO1

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station MERI

SIRGAS Analysis Centre at DGFI, 2010-07-02

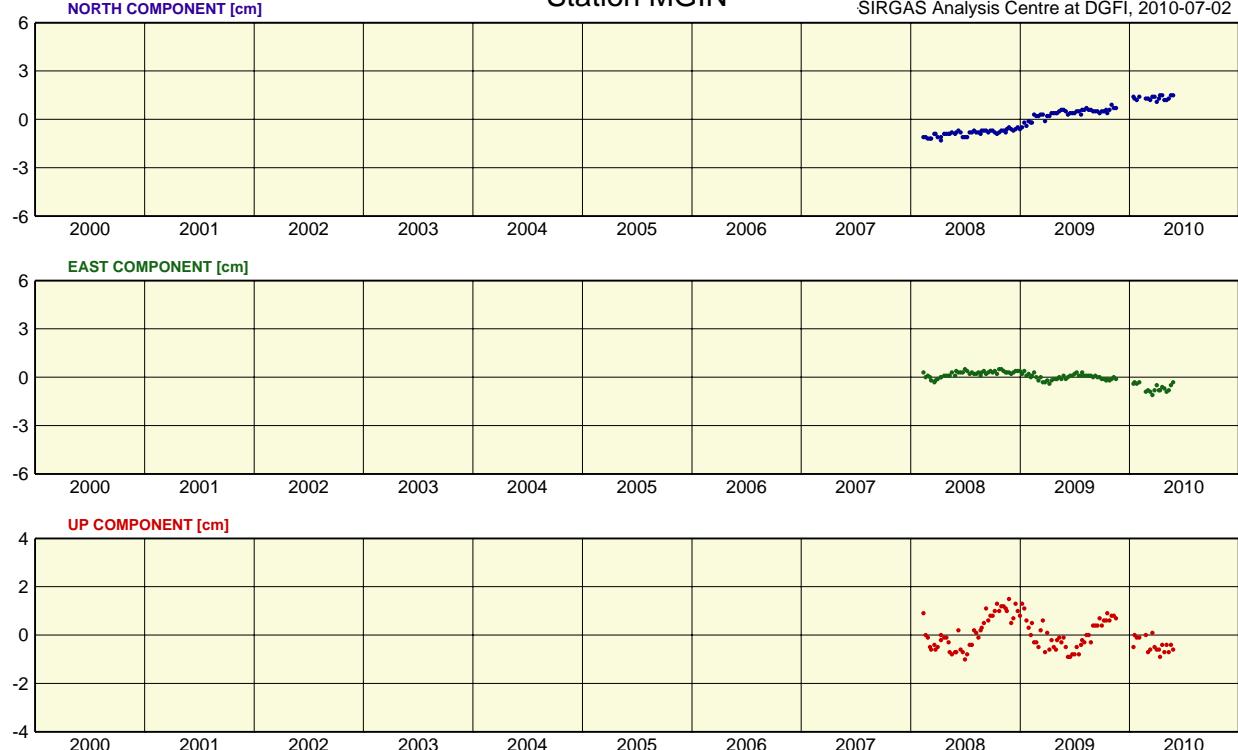

Station MEDE

SIRGAS Analysis Centre at DGFI, 2010-07-02

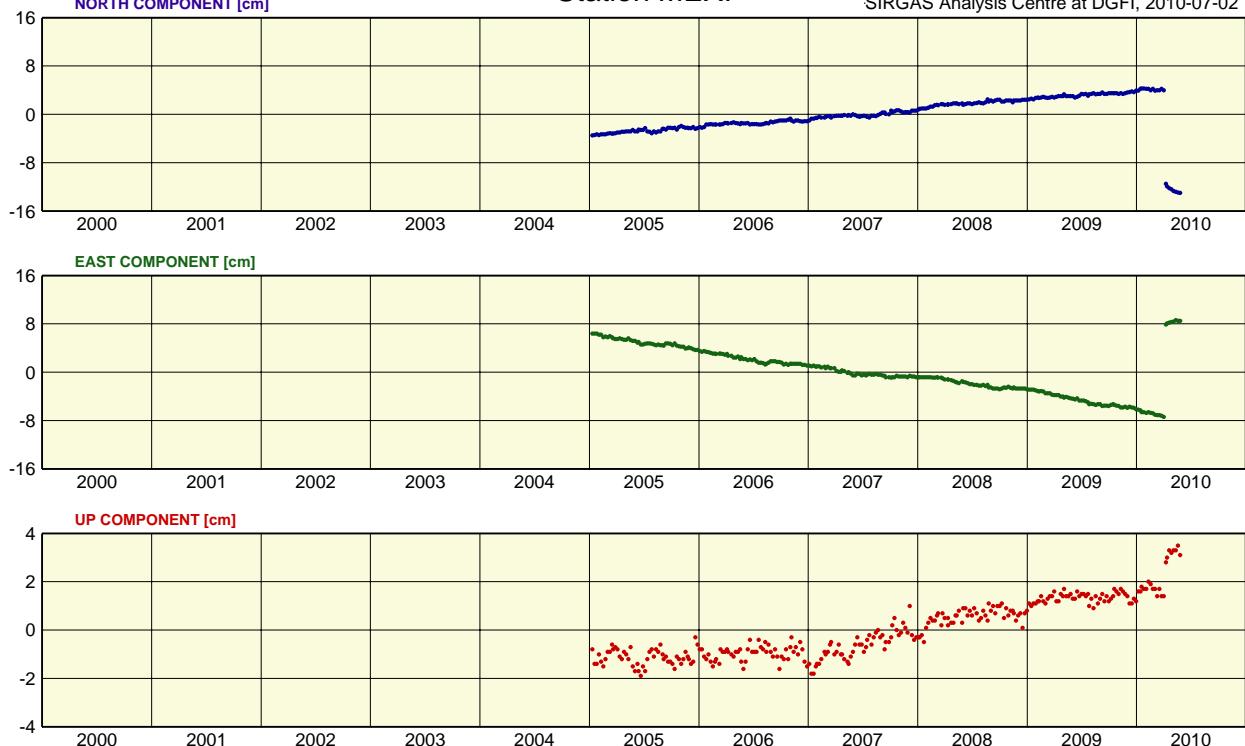

Station MGIN

SIRGAS Analysis Centre at DGFI, 2010-07-02

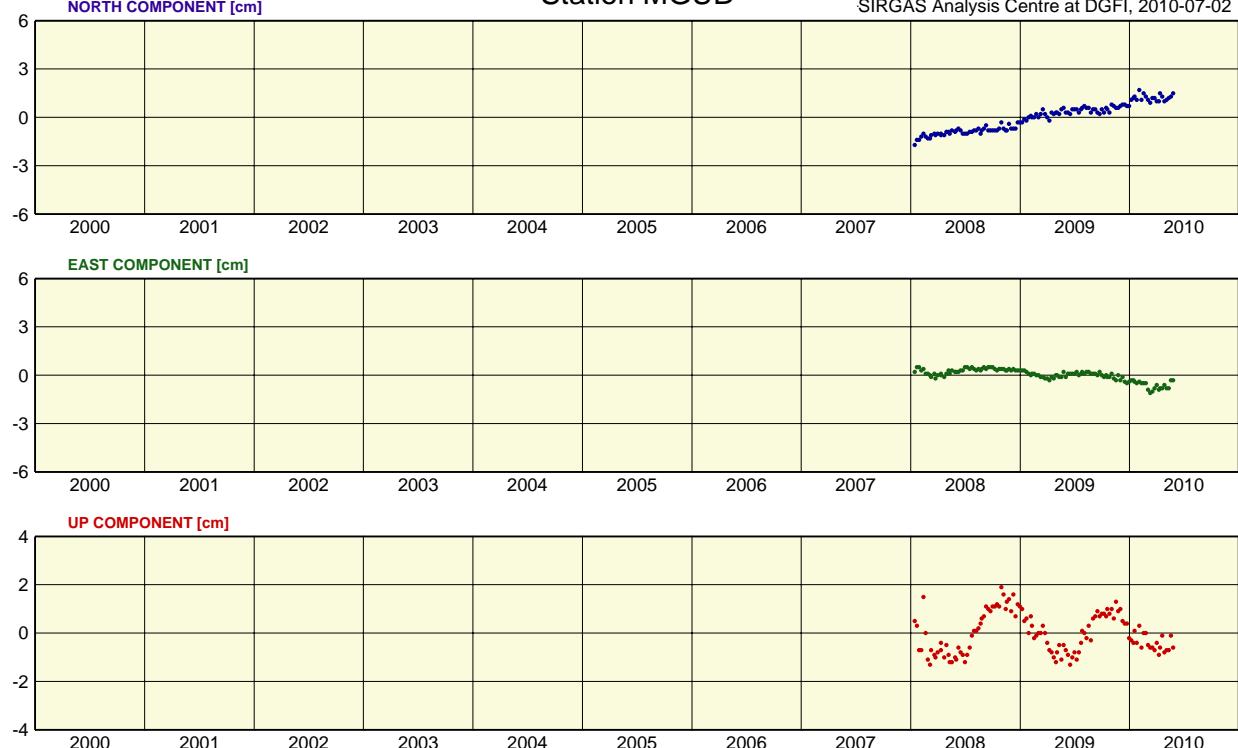

Station MEXI

SIRGAS Analysis Centre at DGFI, 2010-07-02

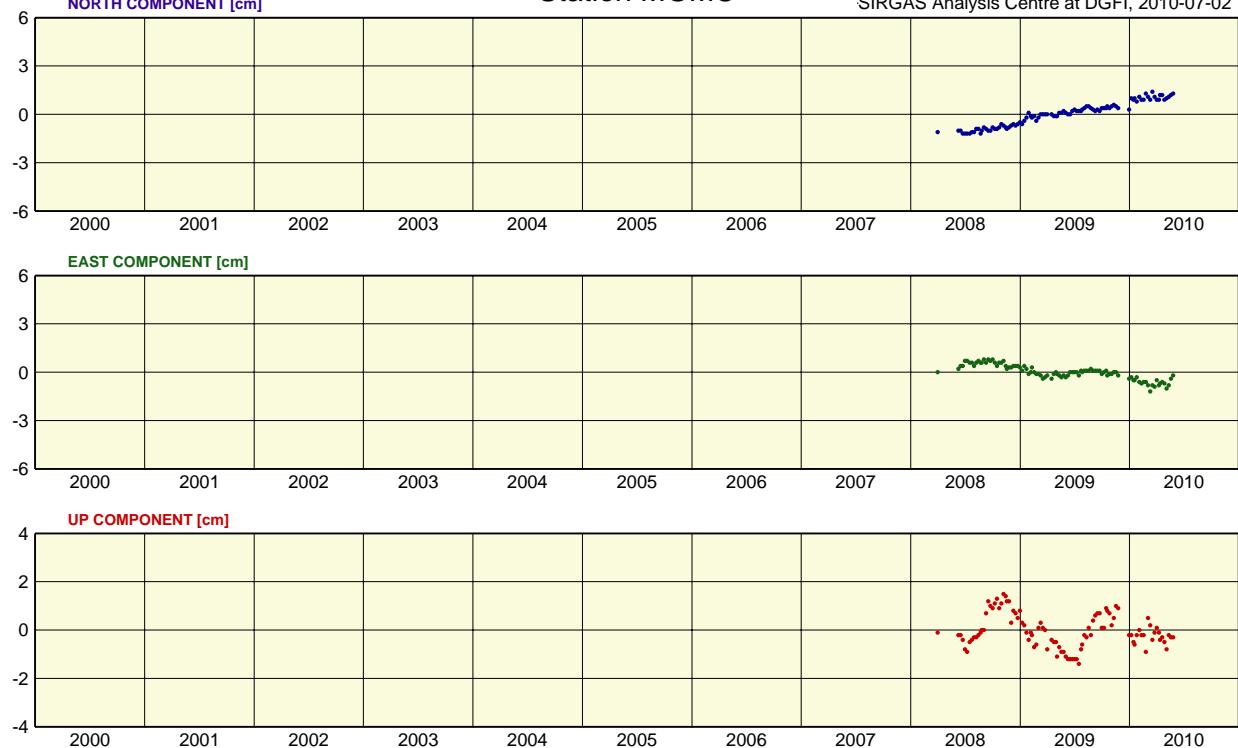

Station MGUB

SIRGAS Analysis Centre at DGFI, 2010-07-02

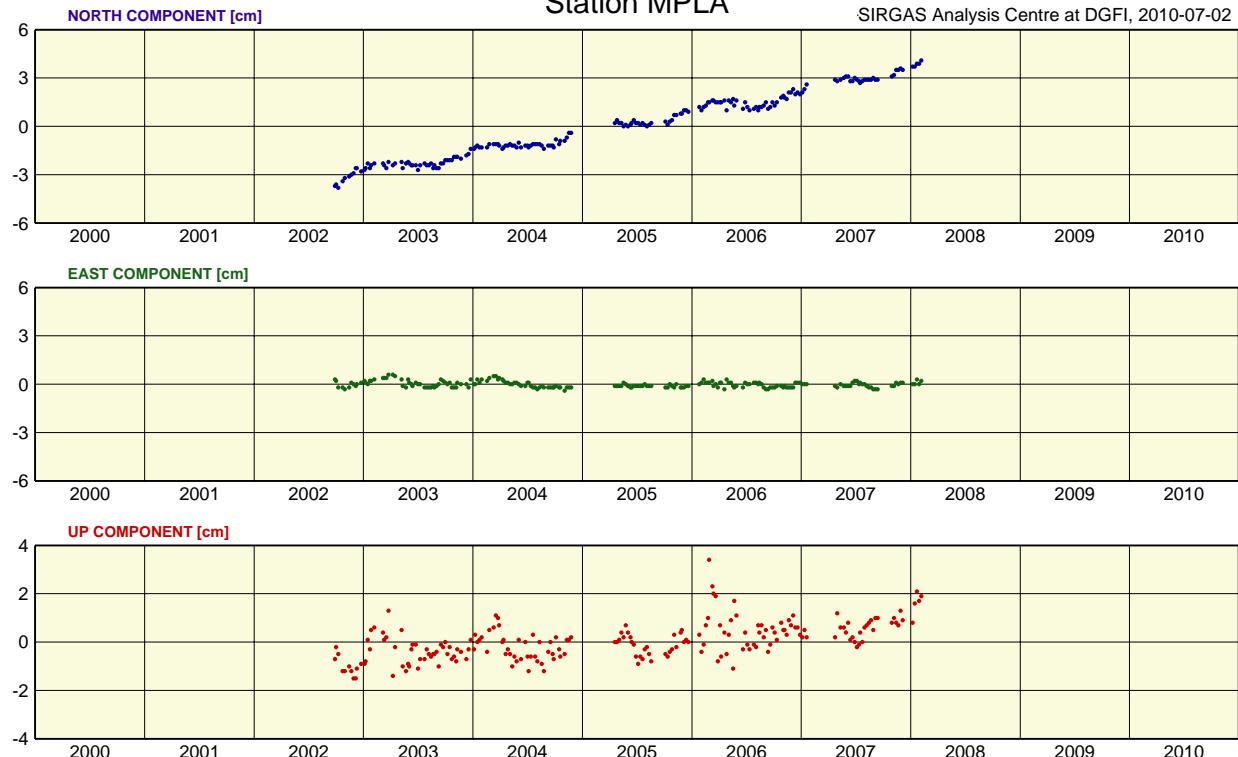

Station MGMC

SIRGAS Analysis Centre at DGFI, 2010-07-02

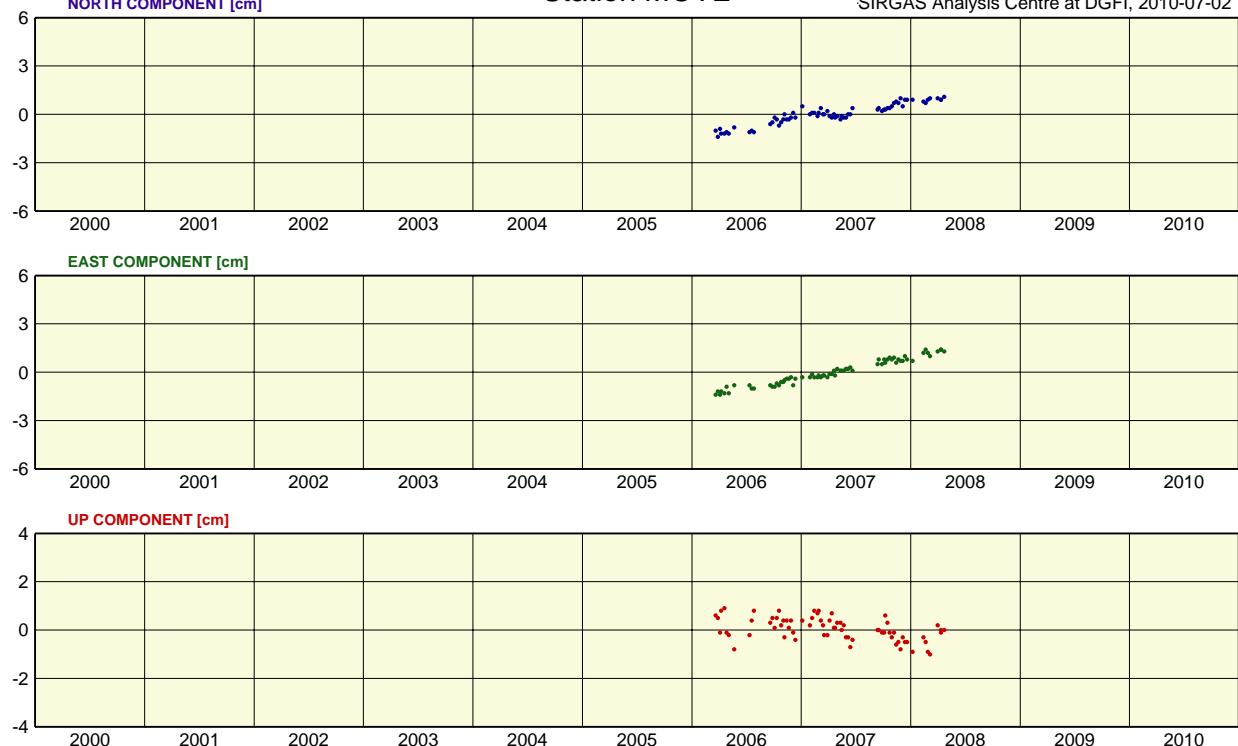

Station MPLA

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station MOTE

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station MTBA

SIRGAS Analysis Centre at DGFI, 2010-07-02

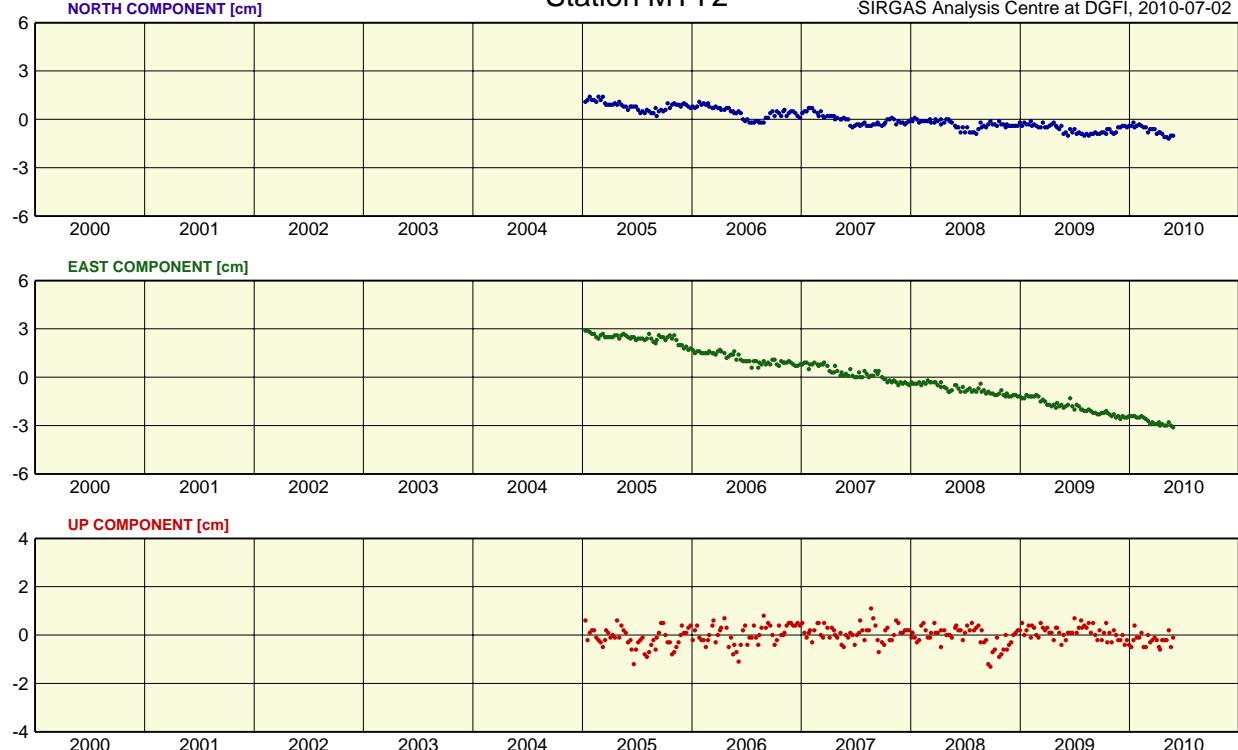

Station MSCG

SIRGAS Analysis Centre at DGFI, 2010-07-02

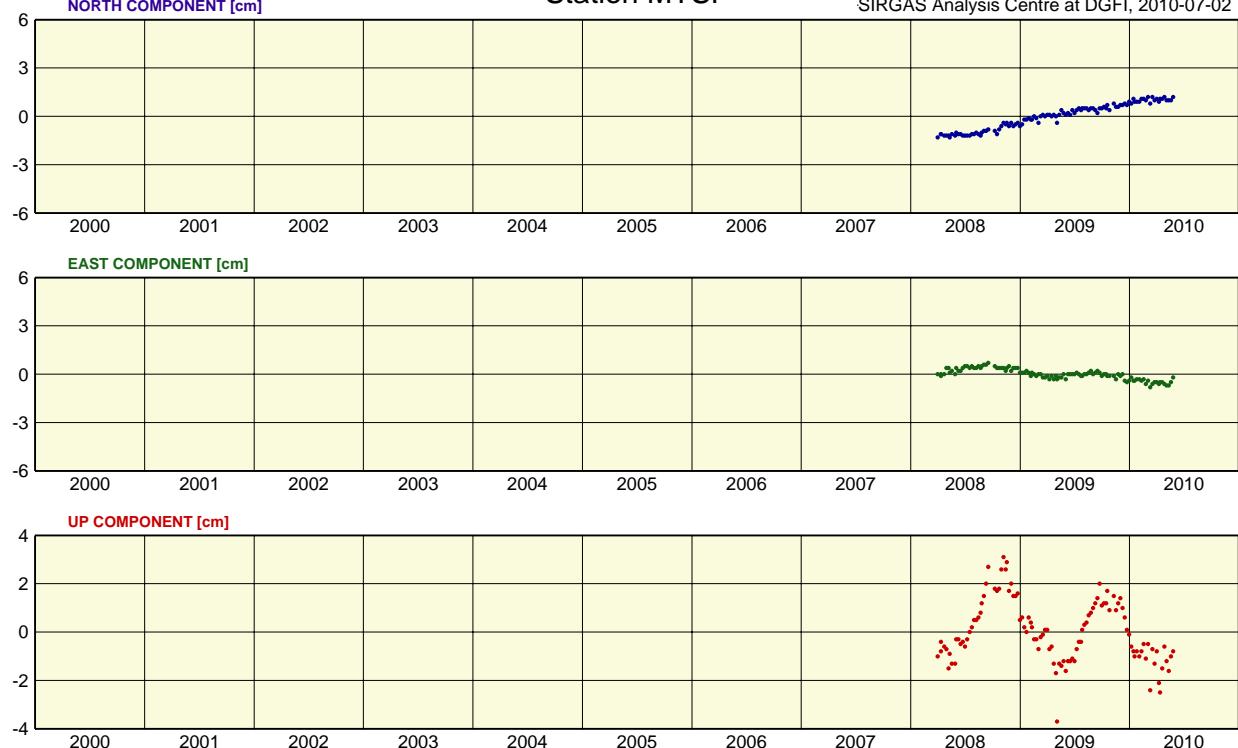

Station MTY2

SIRGAS Analysis Centre at DGFI, 2010-07-02

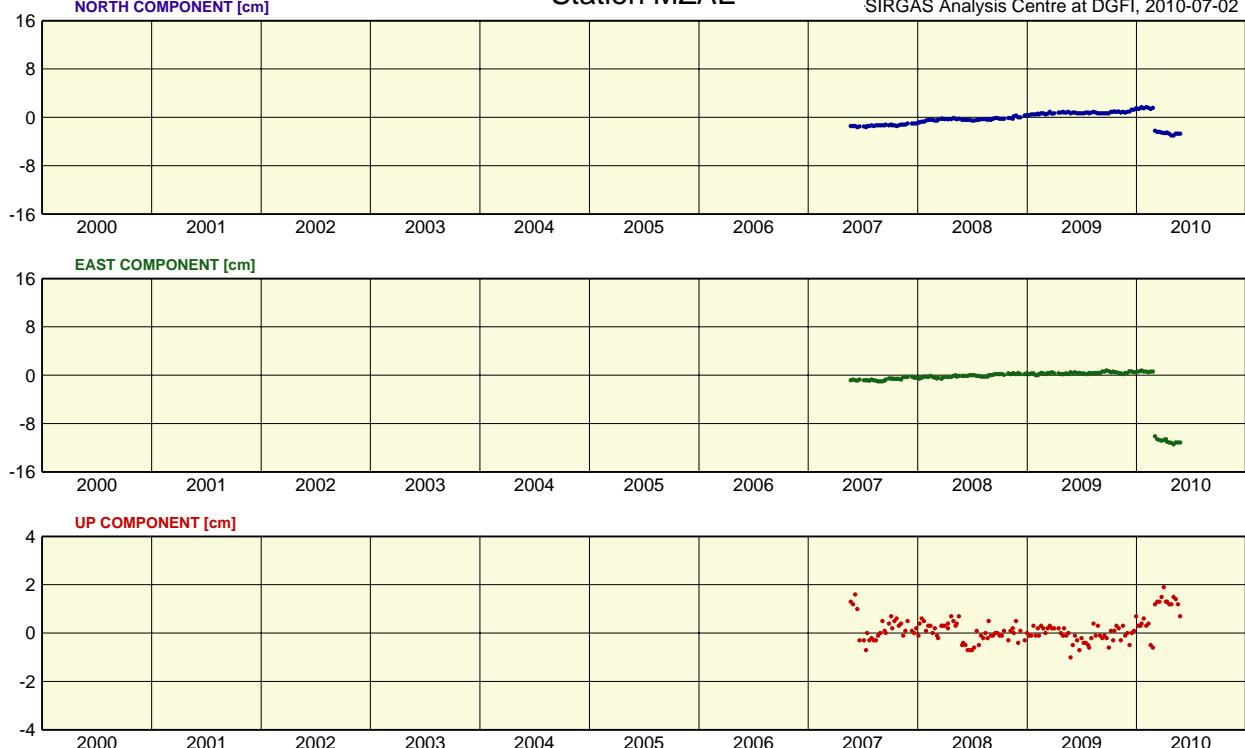

Station MTSF

SIRGAS Analysis Centre at DGFI, 2010-07-02

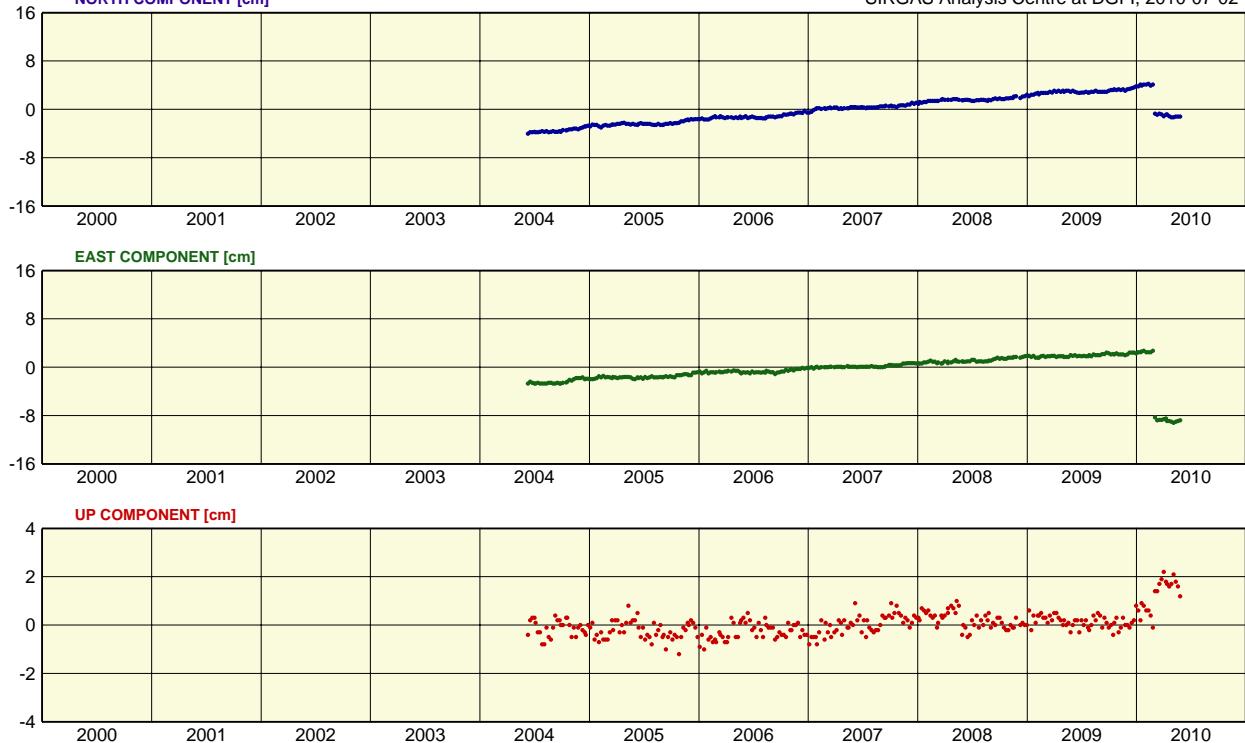

Station MZAE

SIRGAS Analysis Centre at DGFI, 2010-07-02

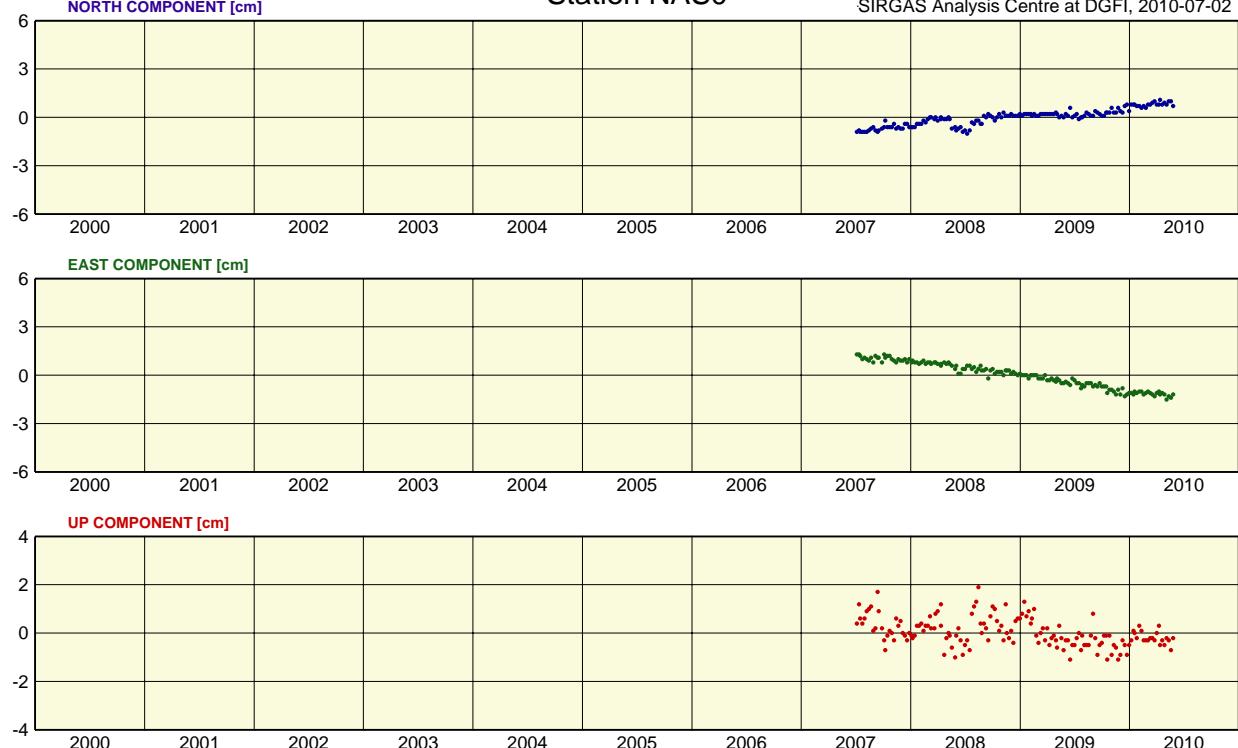

Station MZAC

SIRGAS Analysis Centre at DGFI, 2010-07-02

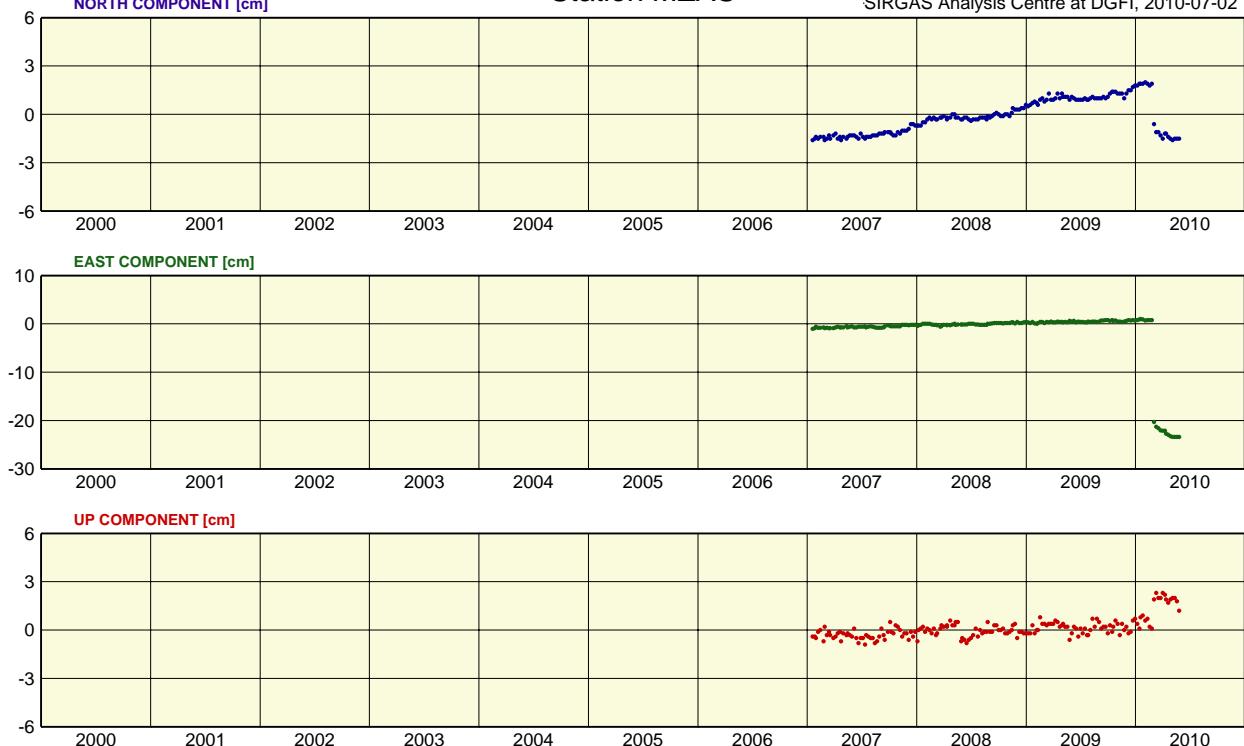

Station NAS0

SIRGAS Analysis Centre at DGFI, 2010-07-02

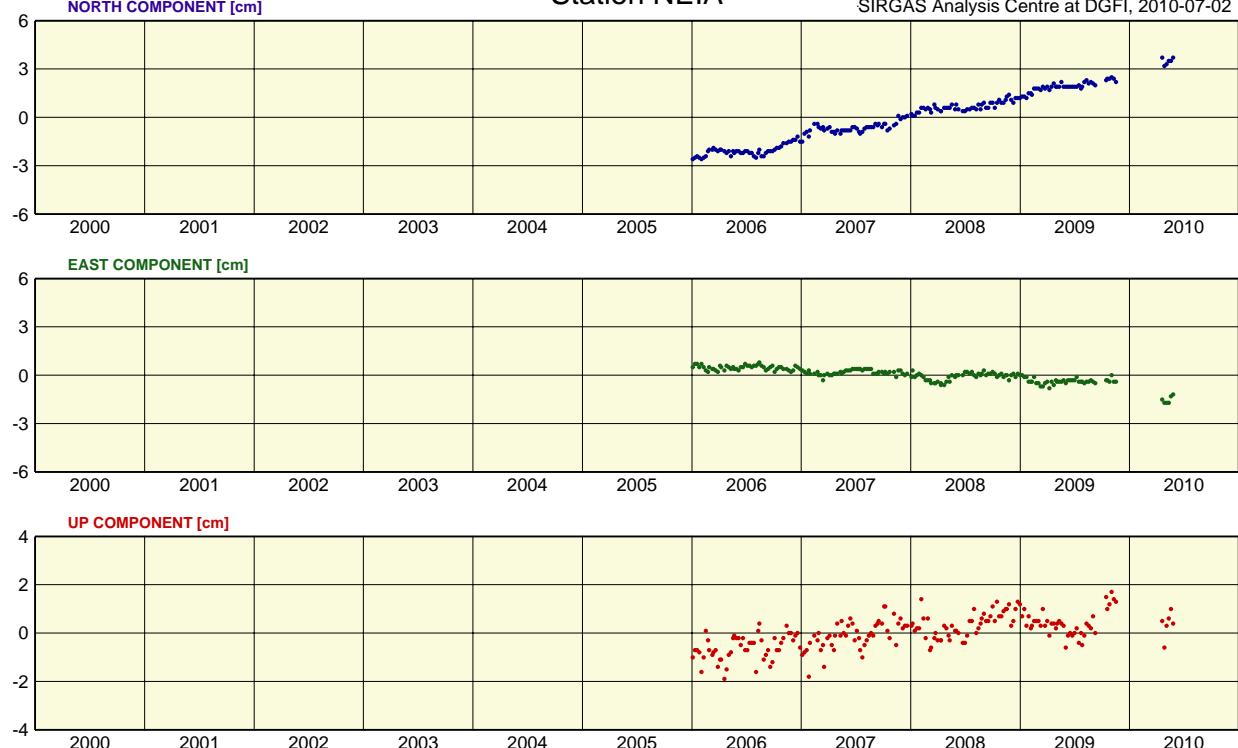

Station MZAS

SIRGAS Analysis Centre at DGFI, 2010-07-02

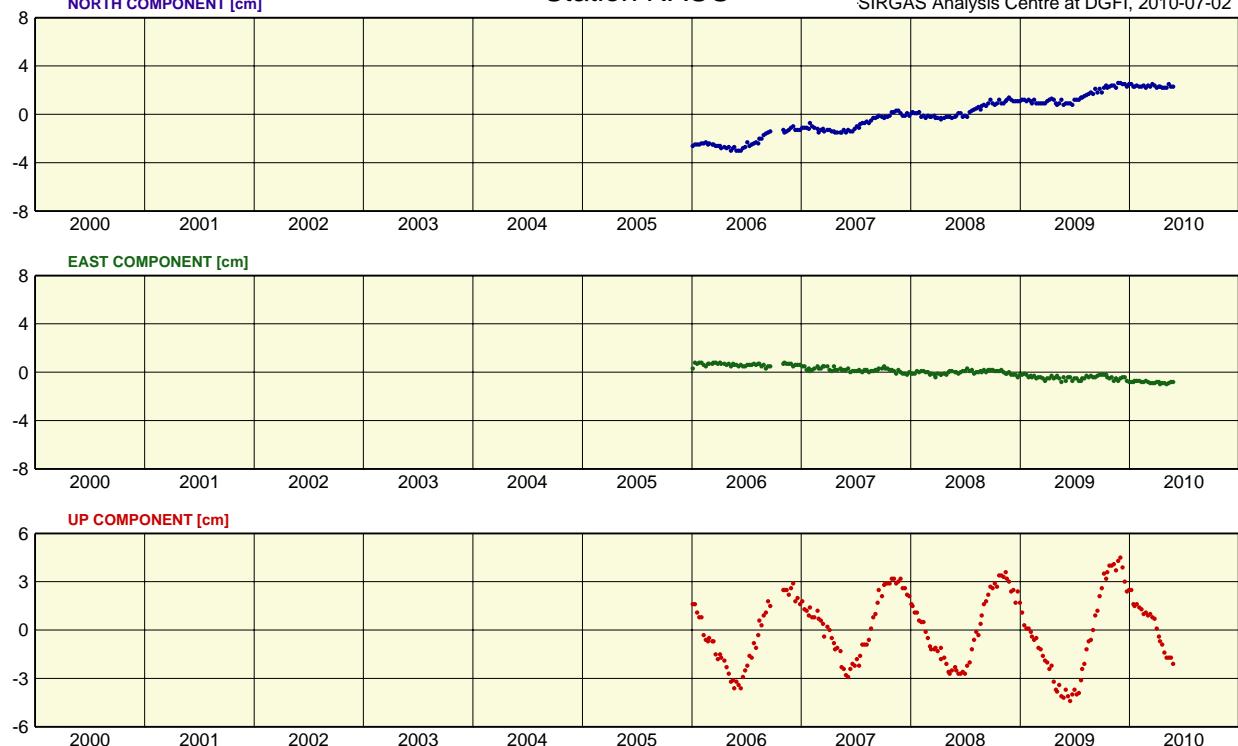

Station NEIA

SIRGAS Analysis Centre at DGFI, 2010-07-02

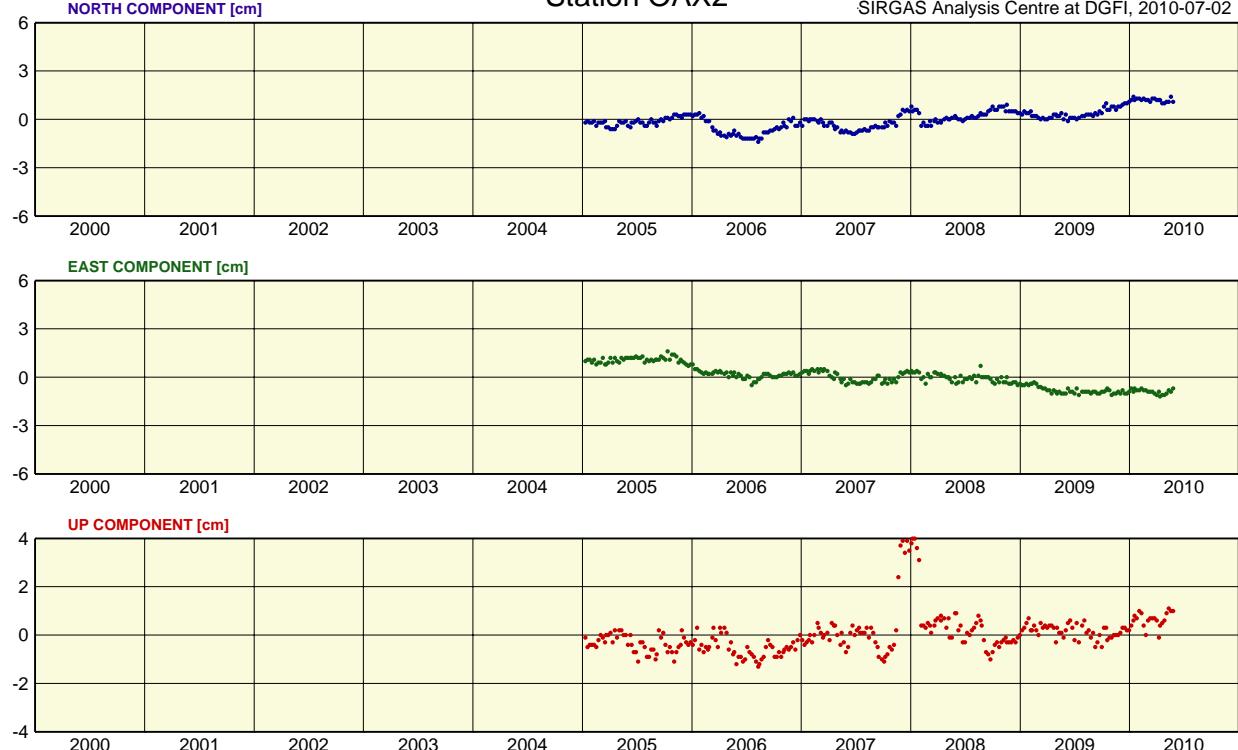

Station NAUS

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station OAX2

SIRGAS Analysis Centre at DGFI, 2010-07-02

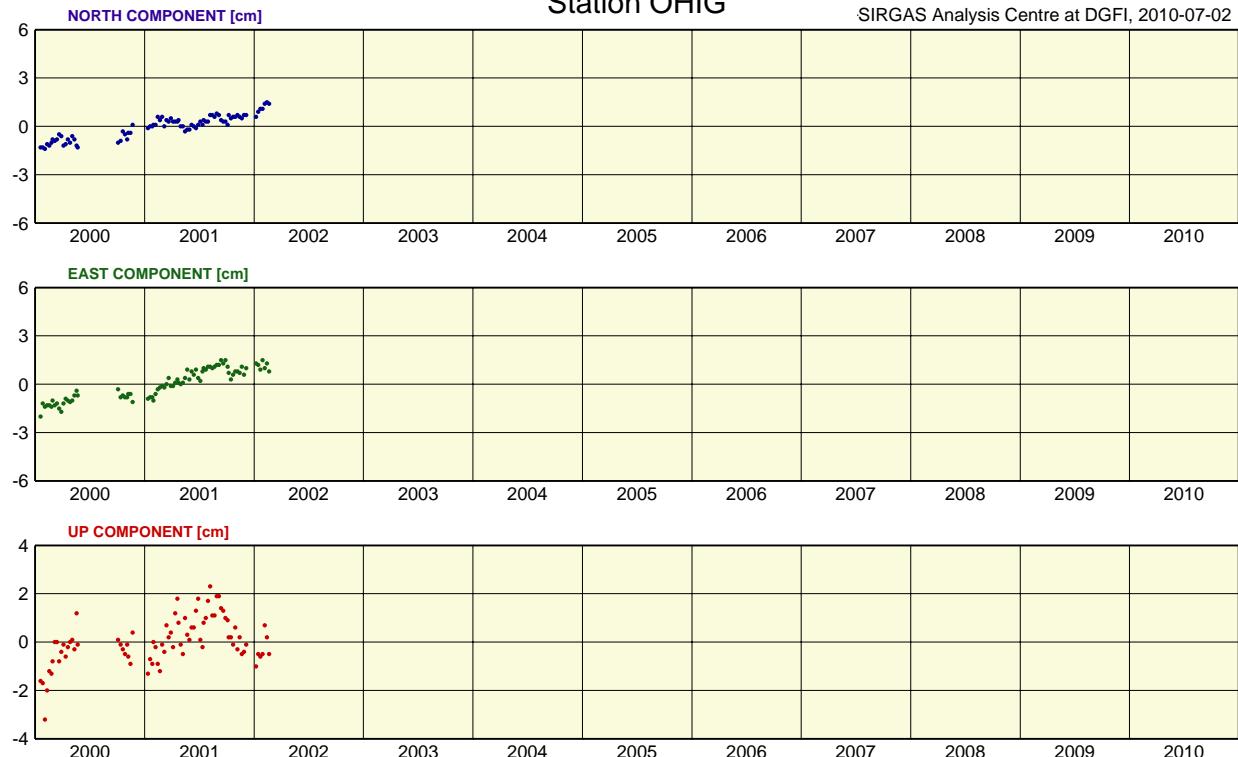

Station NEVA

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station OHIG

SIRGAS Analysis Centre at DGFI, 2010-07-02

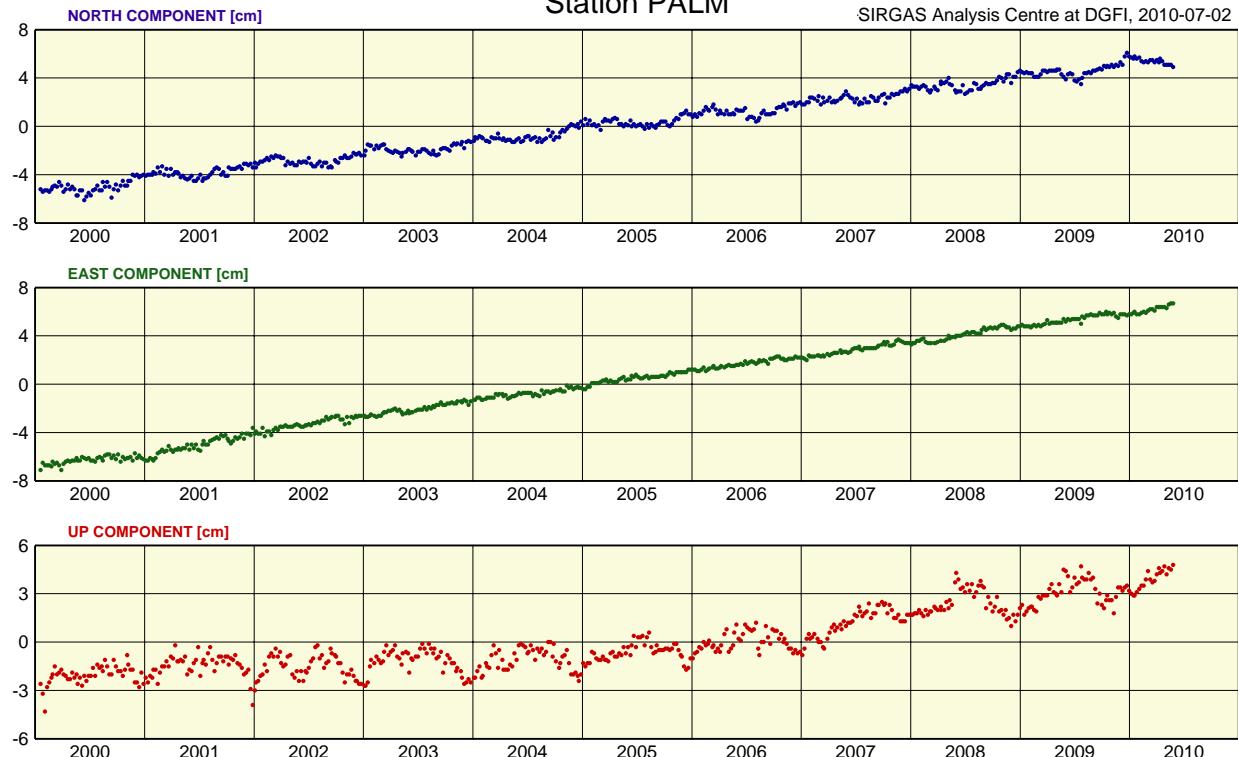

Station OHI2

SIRGAS Analysis Centre at DGFI, 2010-07-02

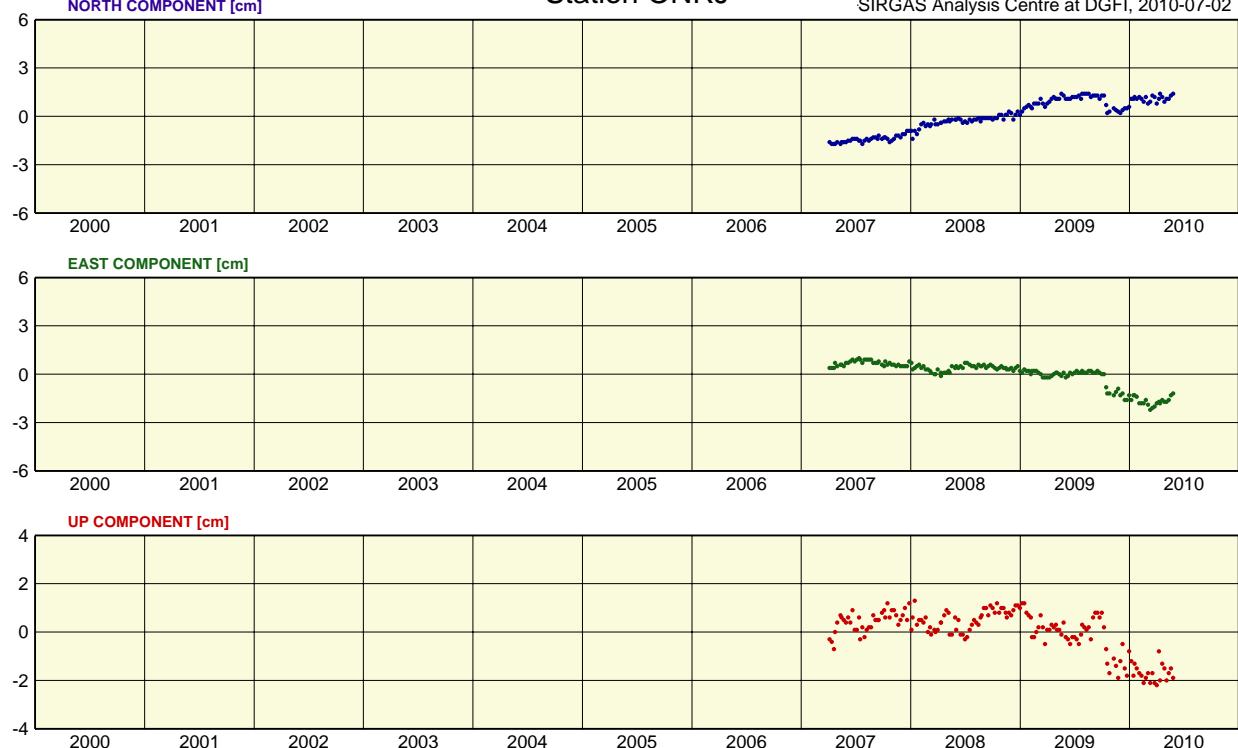

Station PALM

SIRGAS Analysis Centre at DGFI, 2010-07-02

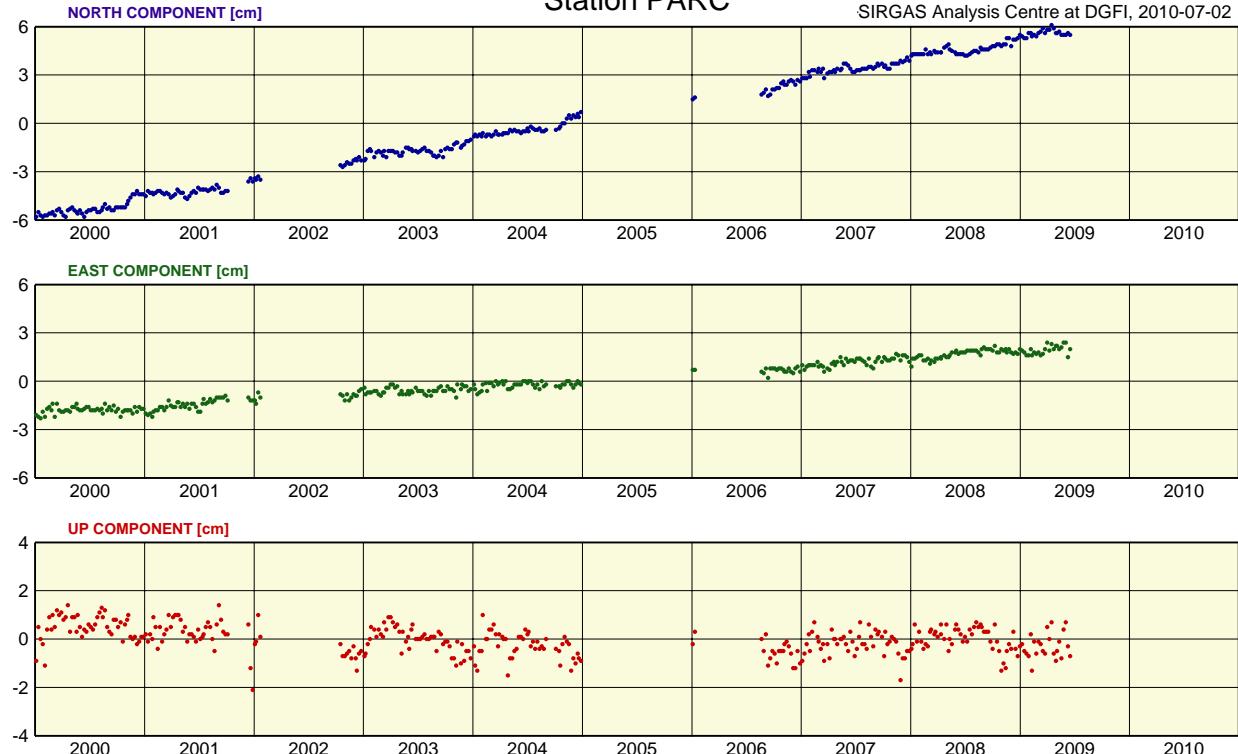

Station ONRJ

SIRGAS Analysis Centre at DGFI, 2010-07-02

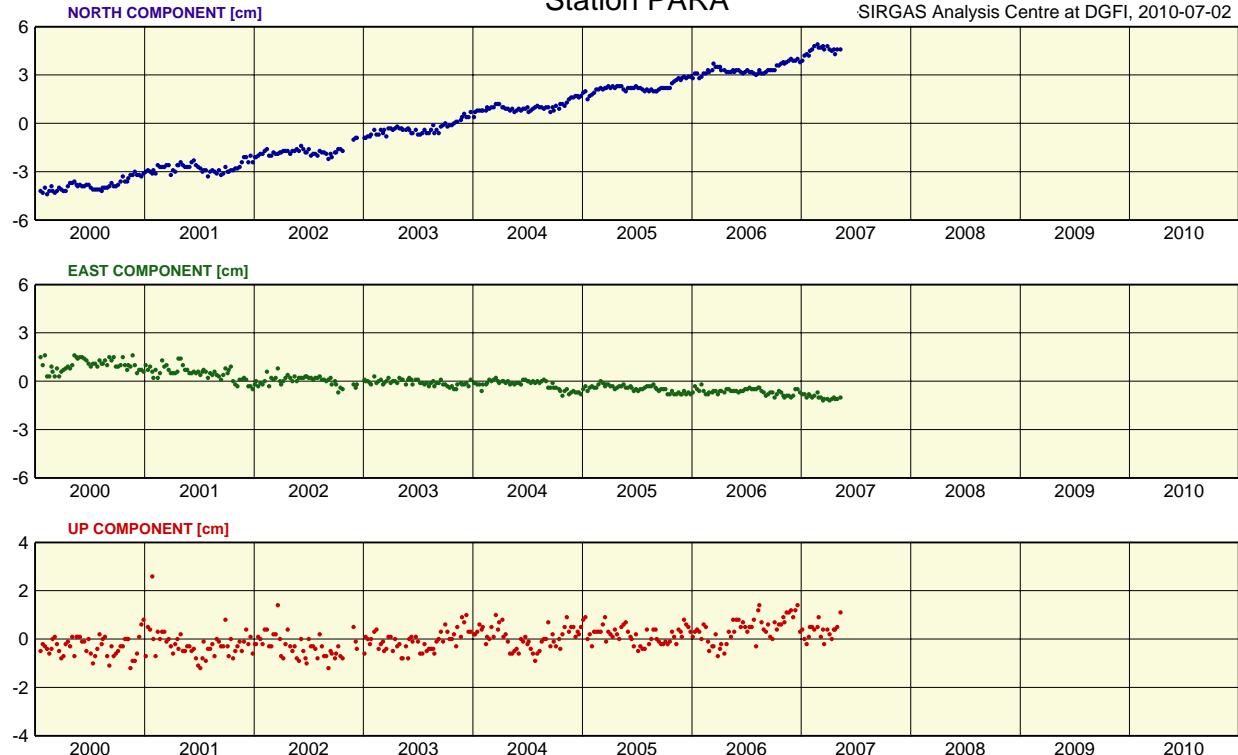

Station PARC

SIRGAS Analysis Centre at DGFI, 2010-07-02

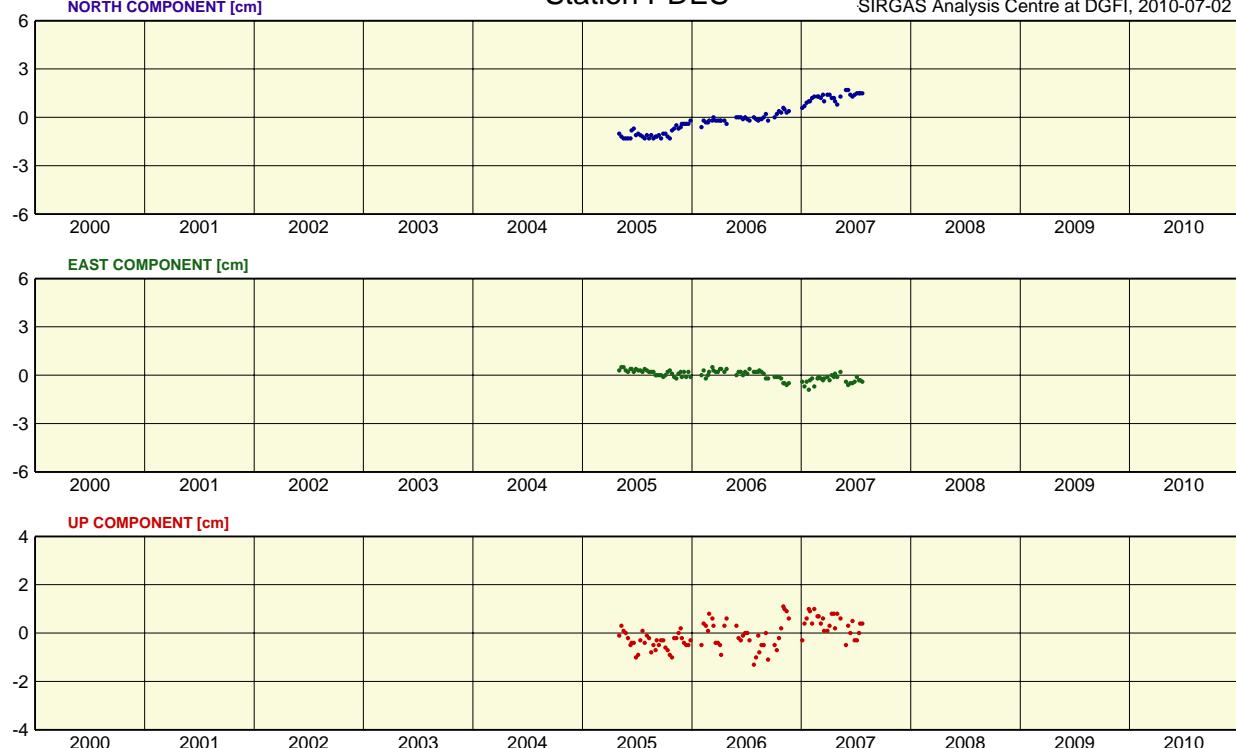

Station PARA

SIRGAS Analysis Centre at DGFI, 2010-07-02

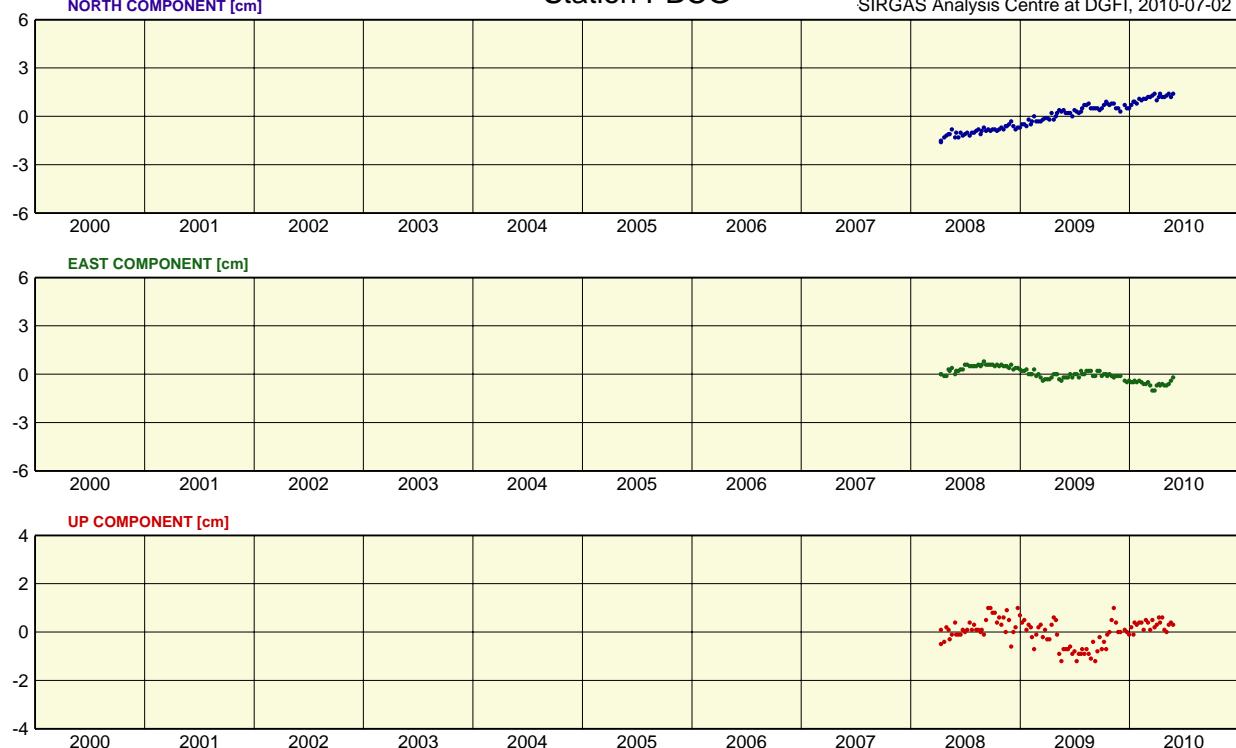

Station PDES

SIRGAS Analysis Centre at DGFI, 2010-07-02

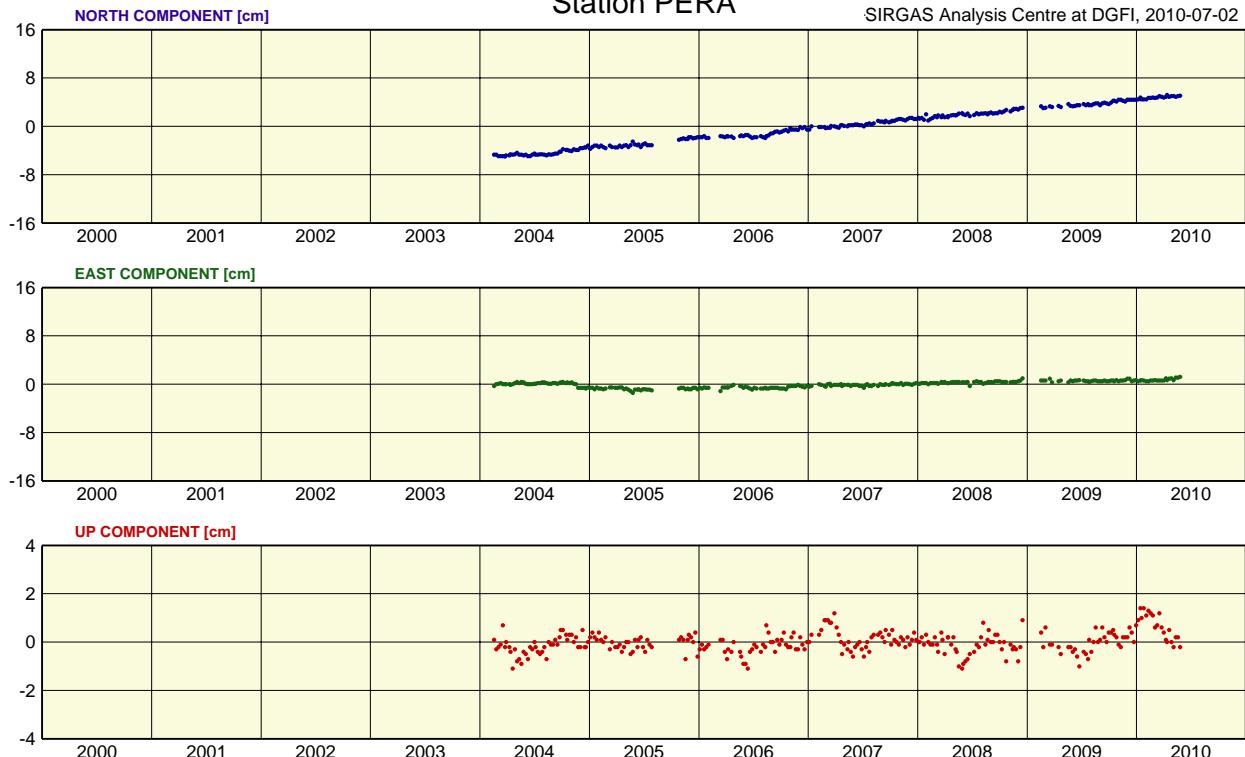

Station PBCG

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station PERA

SIRGAS Analysis Centre at DGFI, 2010-07-02

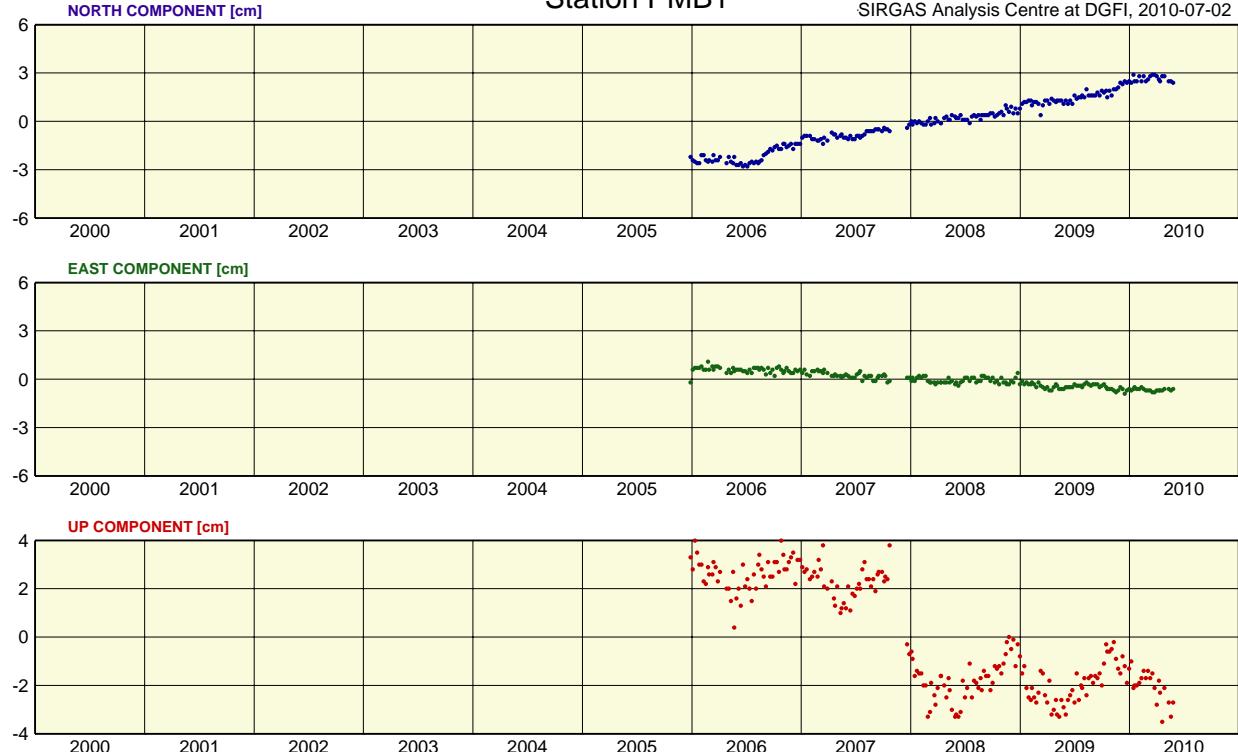

Station PEPE

SIRGAS Analysis Centre at DGFI, 2010-07-02

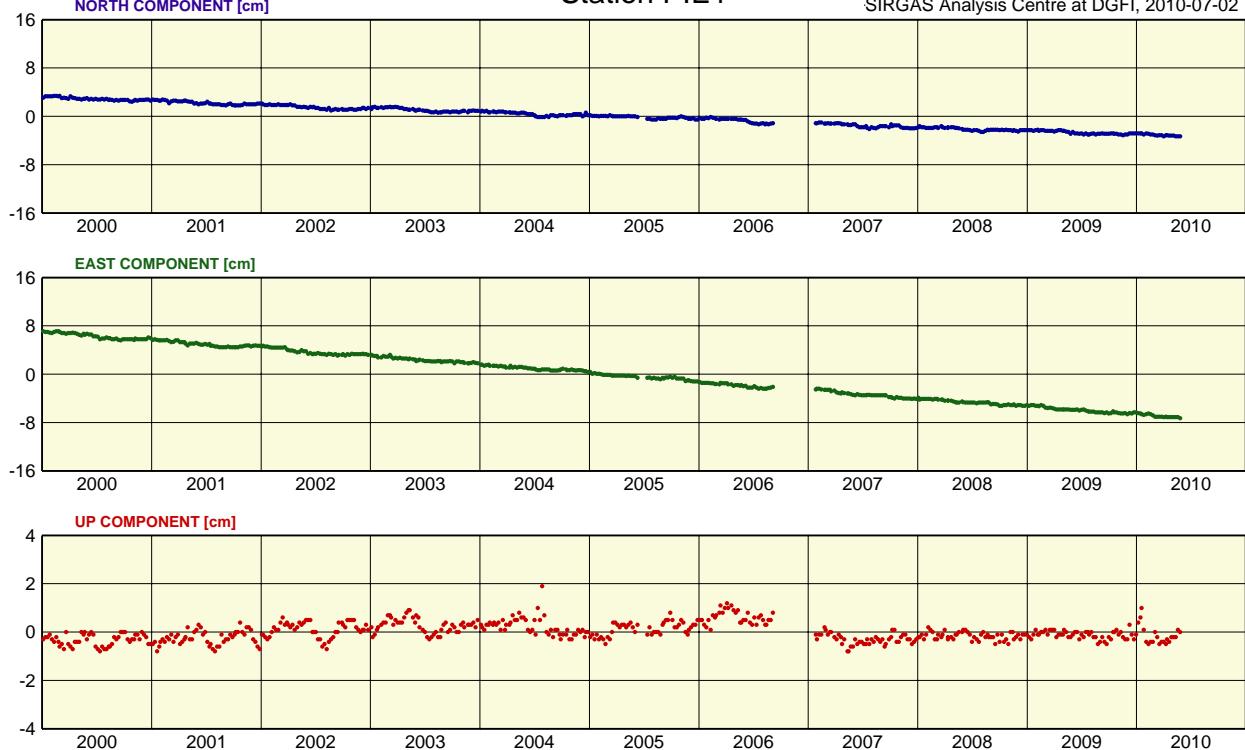

Station PMB1

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station PIE1

SIRGAS Analysis Centre at DGFI, 2010-07-02

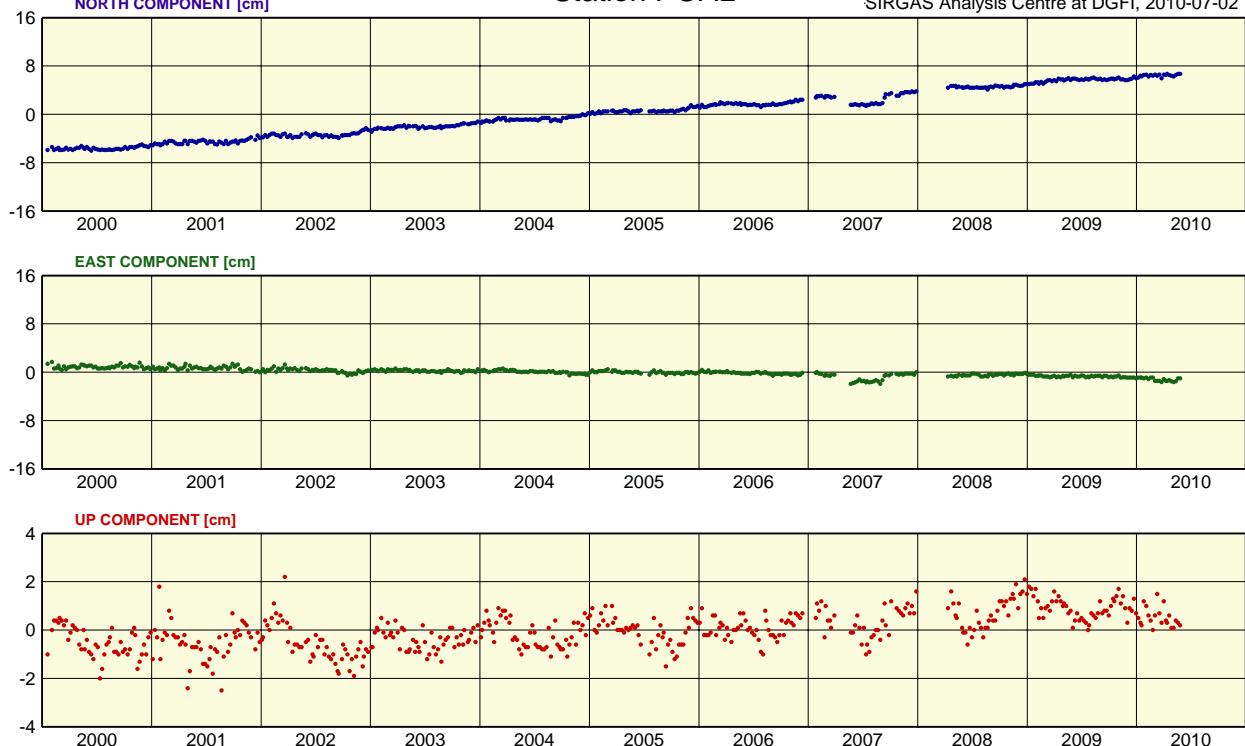

Station POLI

SIRGAS Analysis Centre at DGFI, 2010-07-02

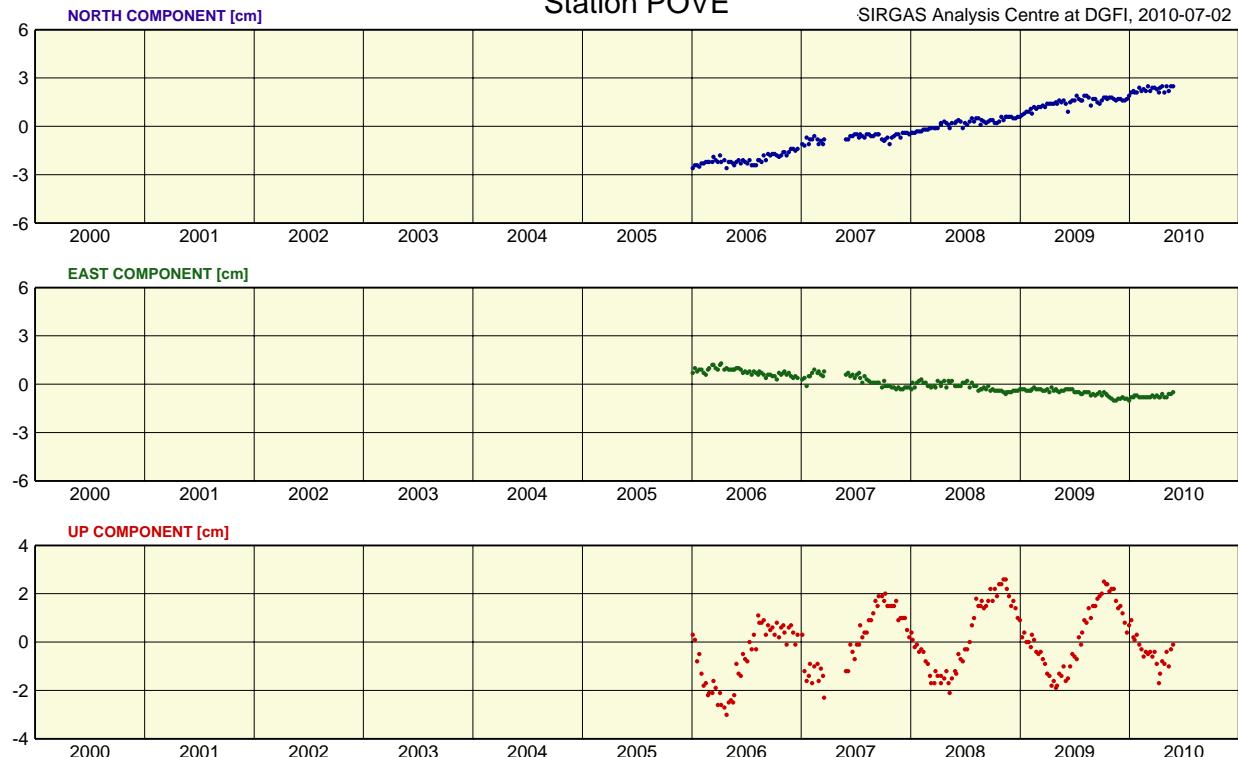

Station POAL

SIRGAS Analysis Centre at DGFI, 2010-07-02

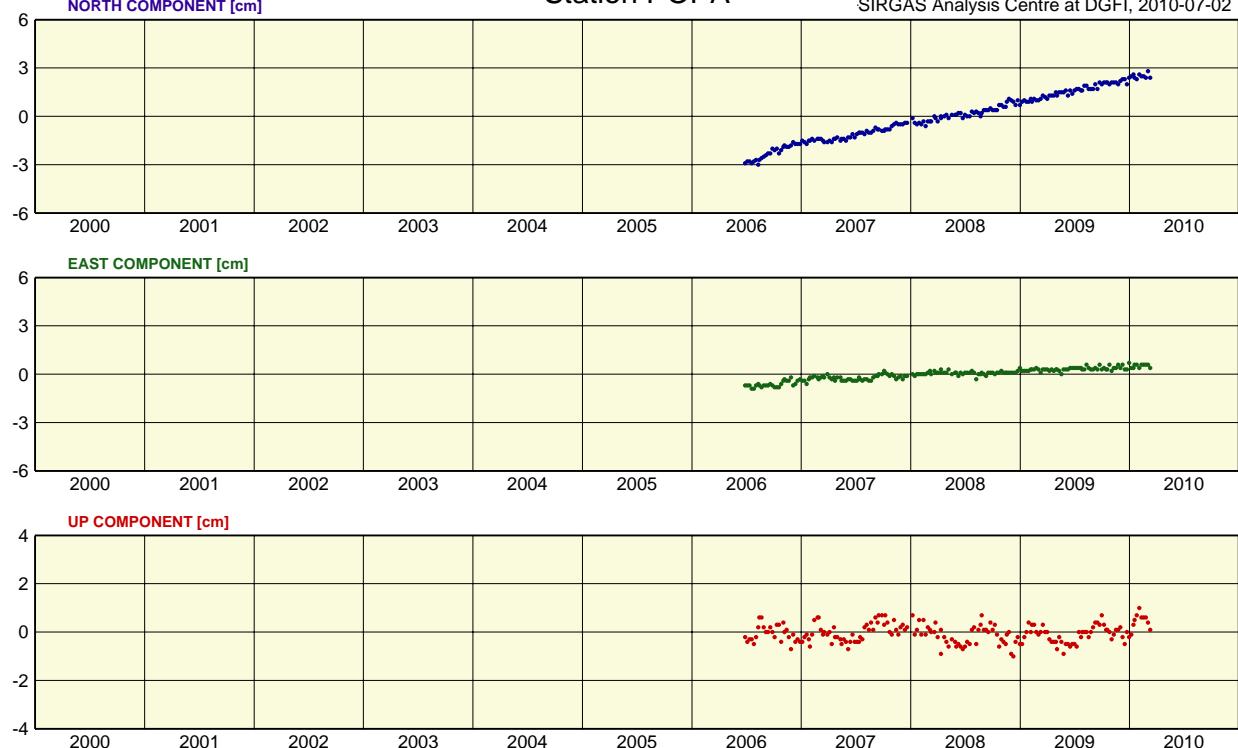

Station POVE

SIRGAS Analysis Centre at DGFI, 2010-07-02

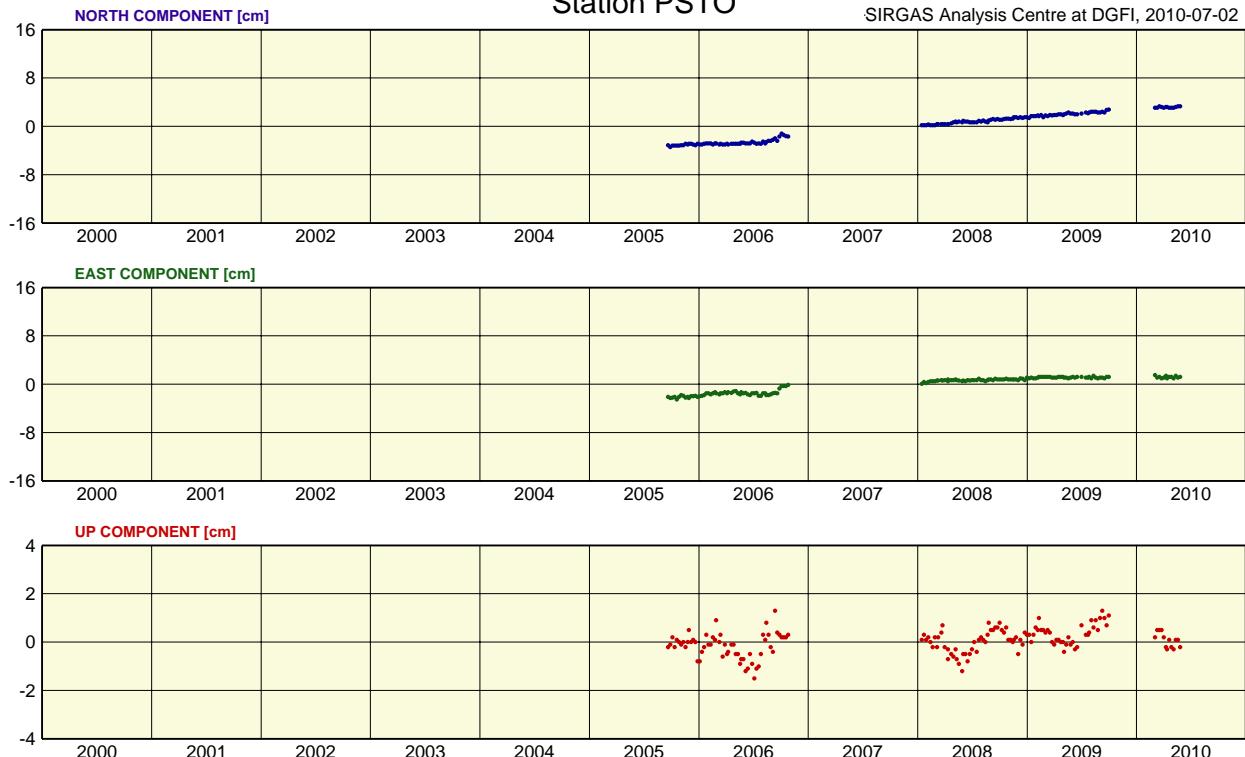

Station POPA

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station PSTO

SIRGAS Analysis Centre at DGFI, 2010-07-02

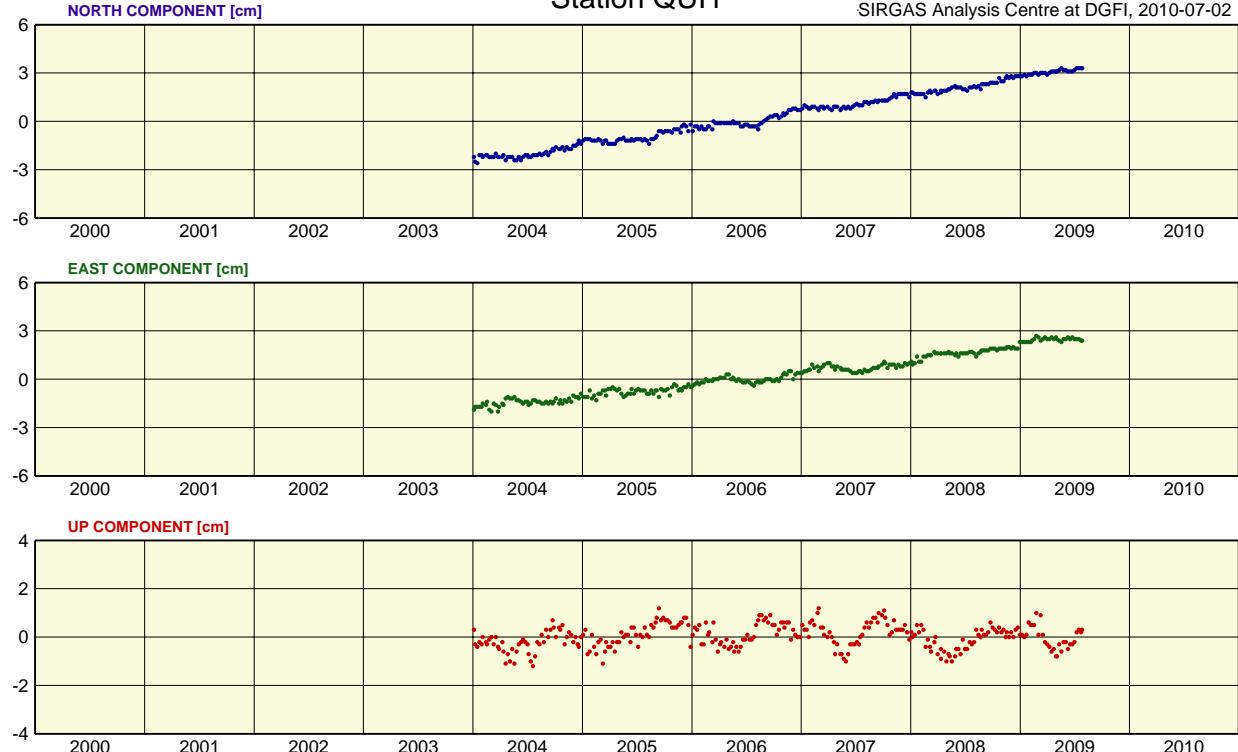

Station PPTE

SIRGAS Analysis Centre at DGFI, 2010-07-02

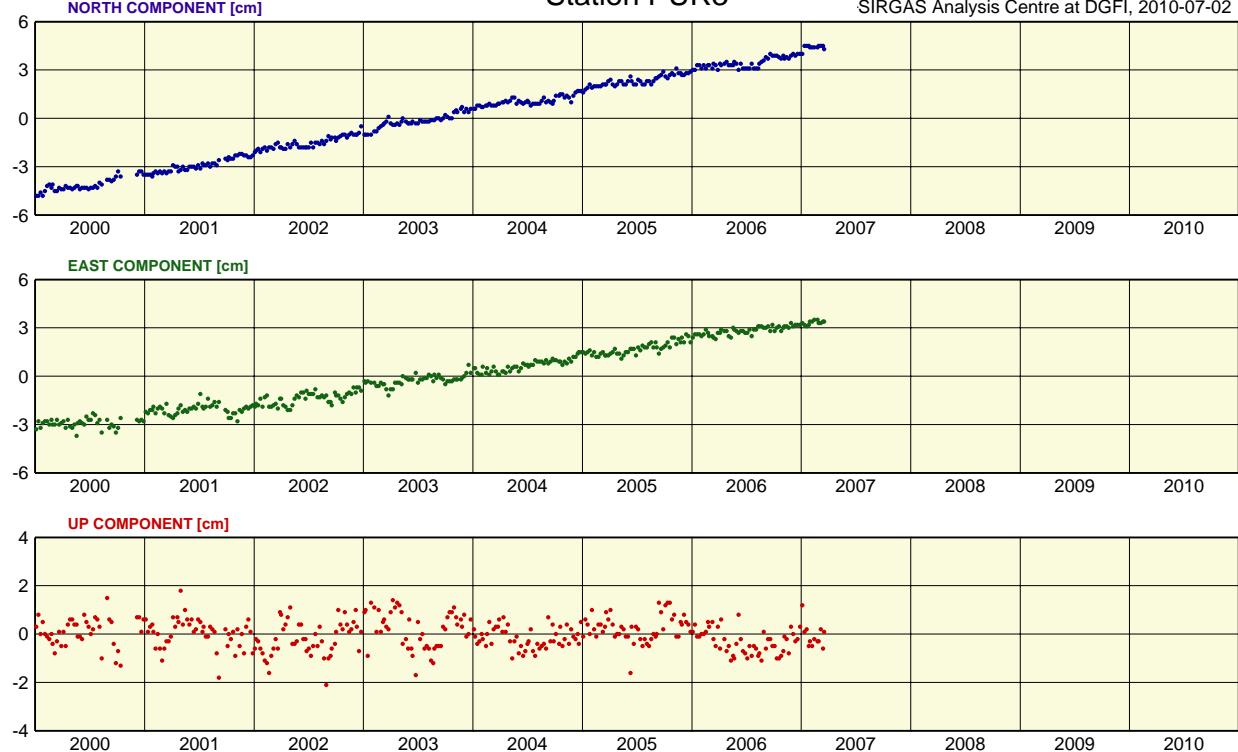

Station QUI1

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station PUR3

SIRGAS Analysis Centre at DGFI, 2010-07-02

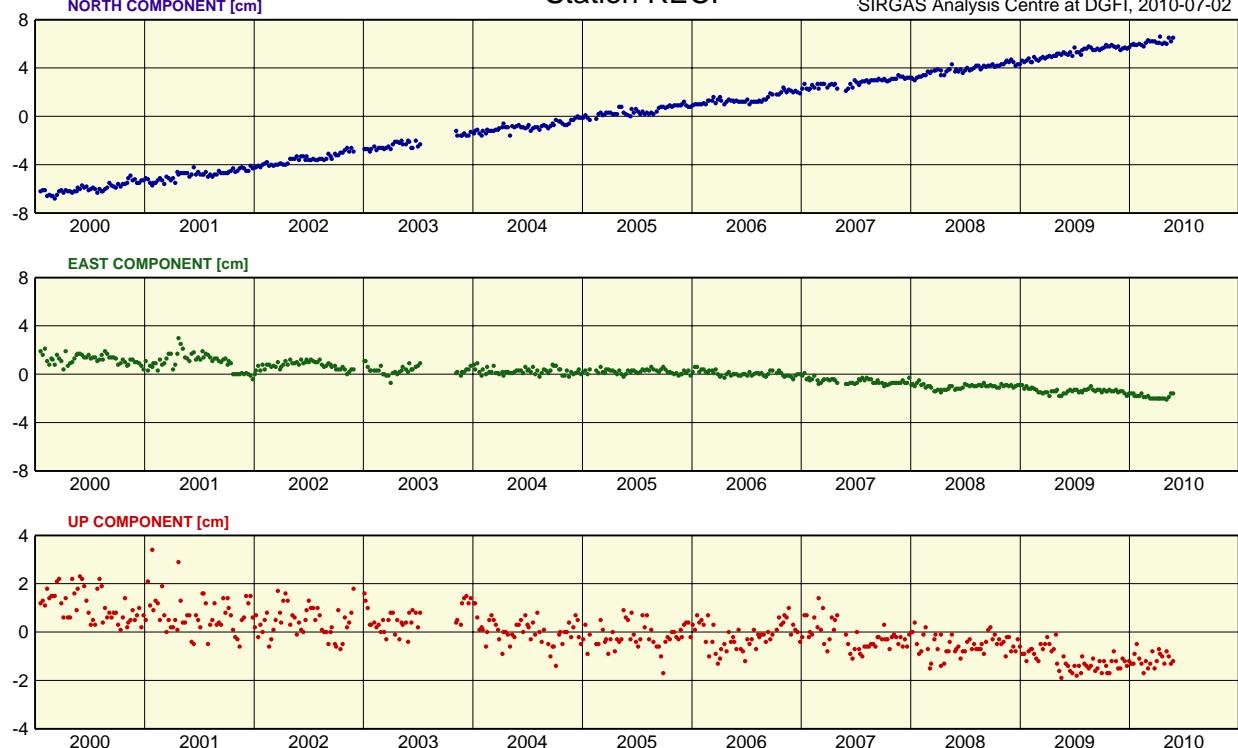

Station RIO2

SIRGAS Analysis Centre at DGFI, 2010-07-02

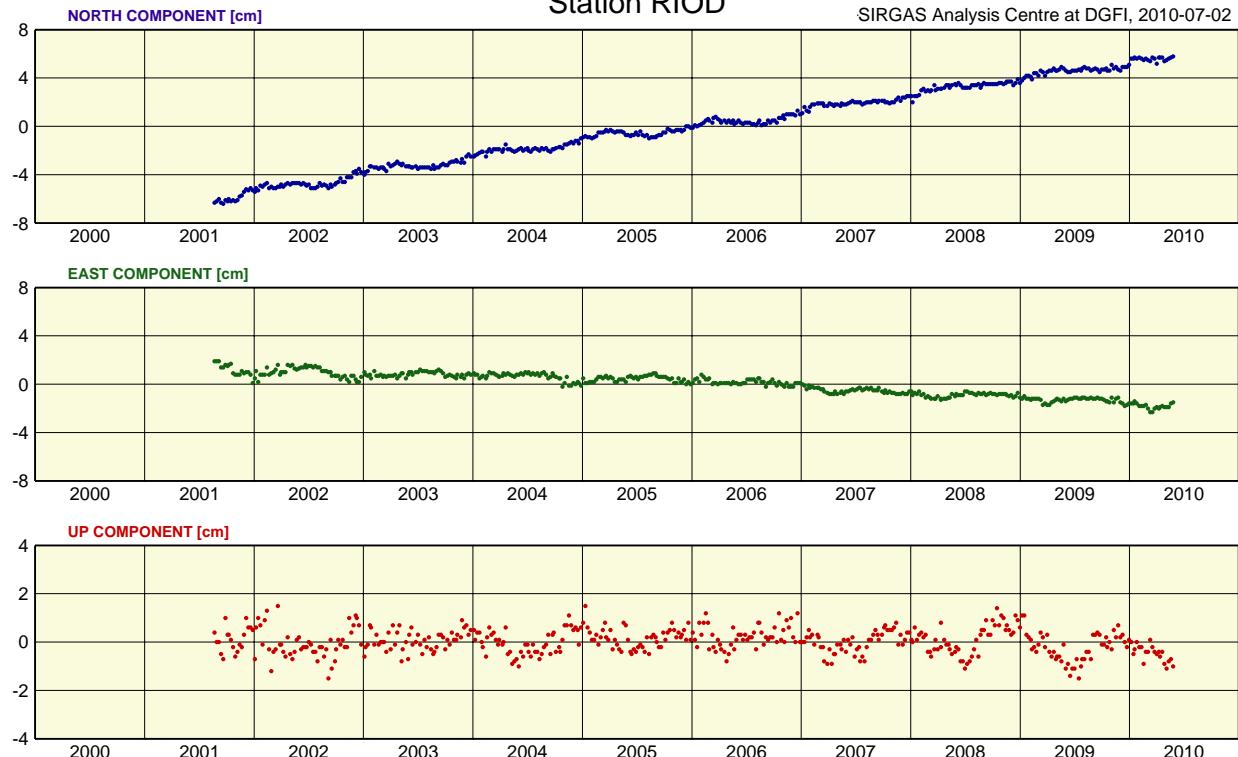

Station RECF

SIRGAS Analysis Centre at DGFI, 2010-07-02

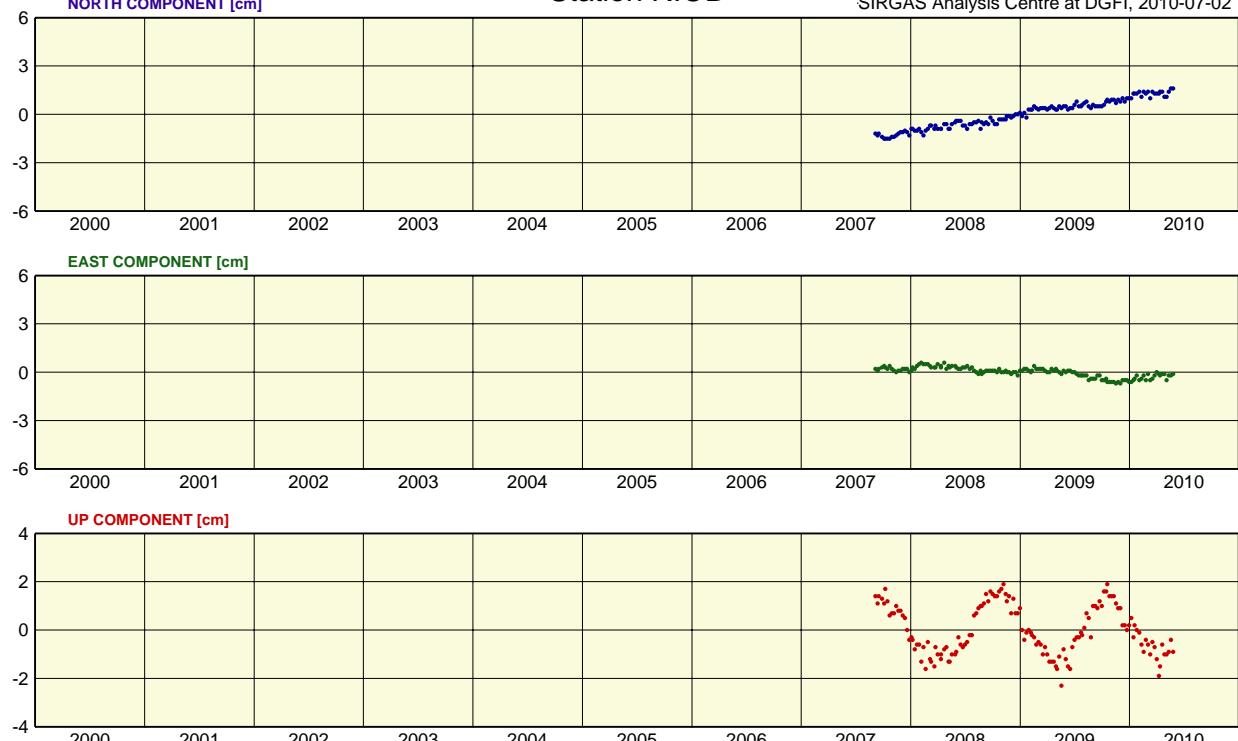

Station RIOD

SIRGAS Analysis Centre at DGFI, 2010-07-02

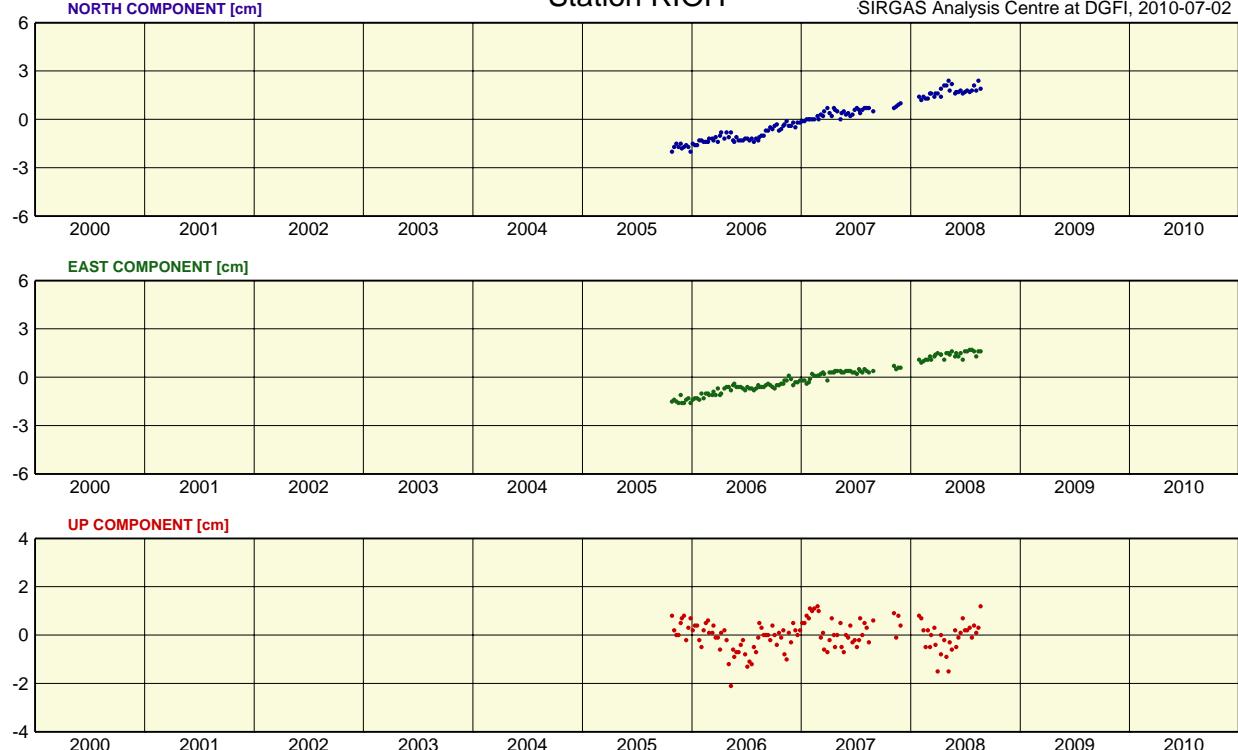

Station RIOB

SIRGAS Analysis Centre at DGFI, 2010-07-02

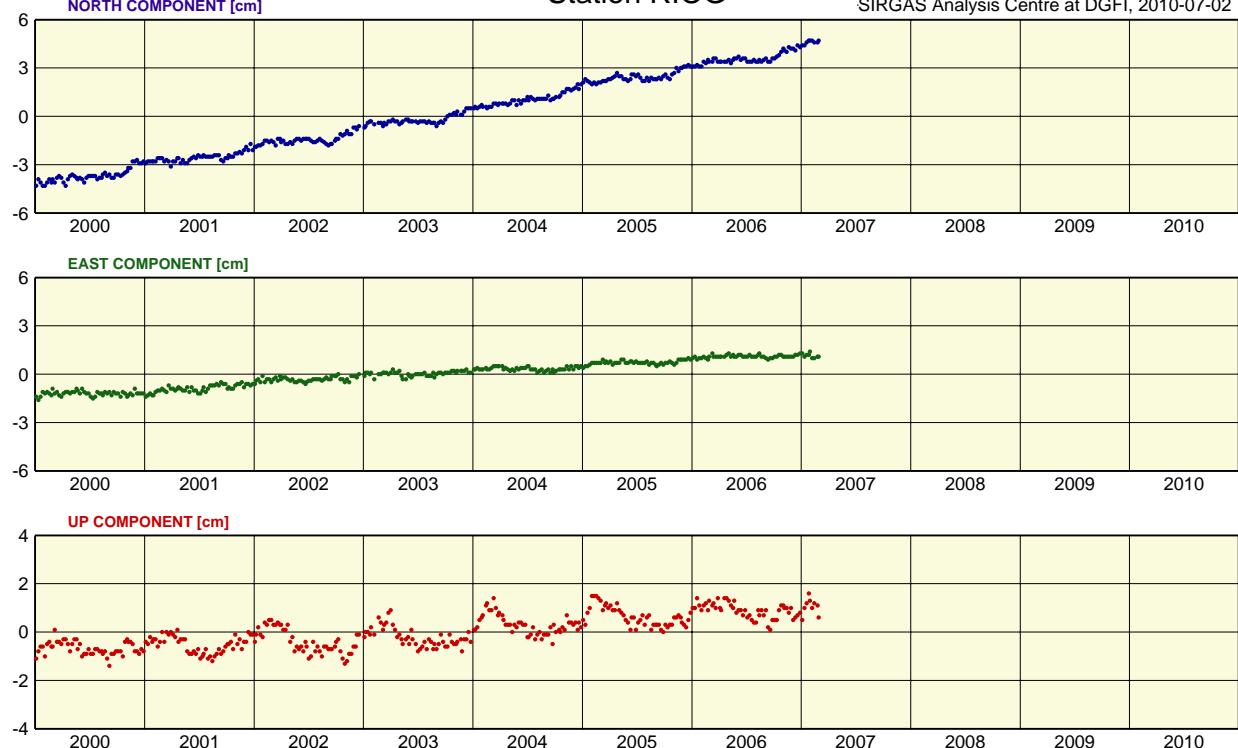

Station RIOH

SIRGAS Analysis Centre at DGFI, 2010-07-02

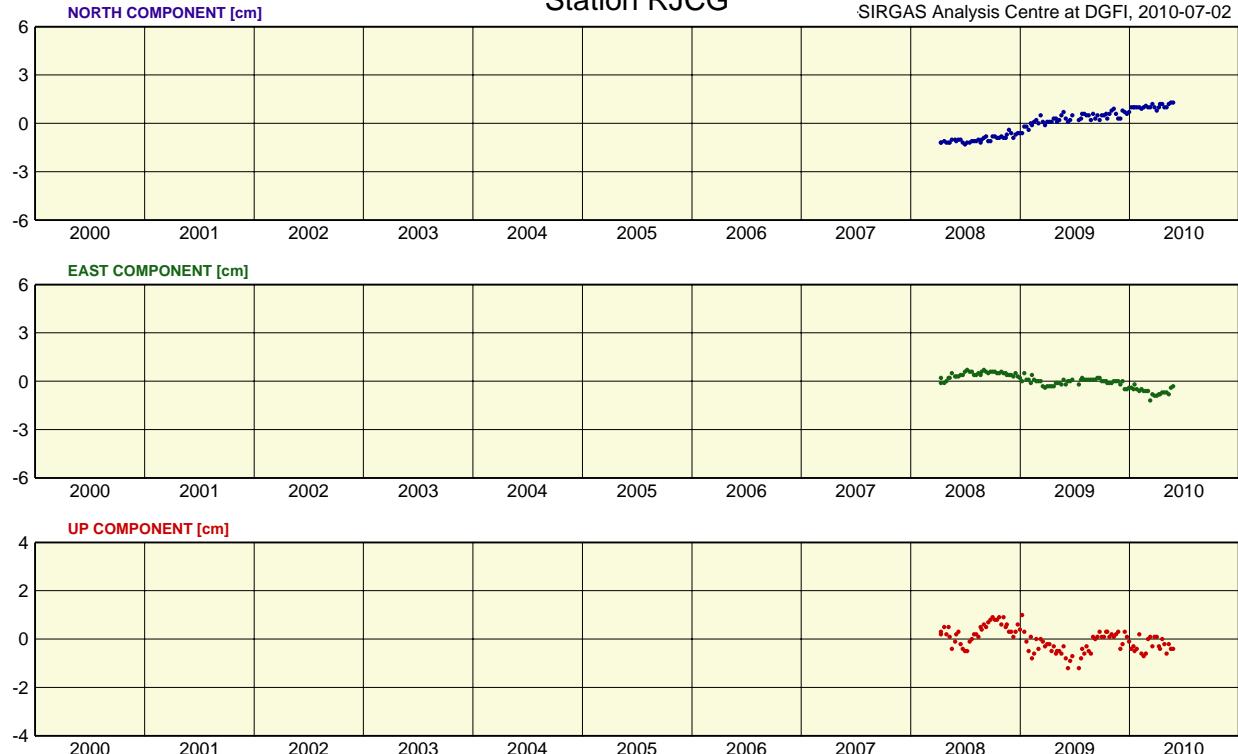

Station RIOG

SIRGAS Analysis Centre at DGFI, 2010-07-02

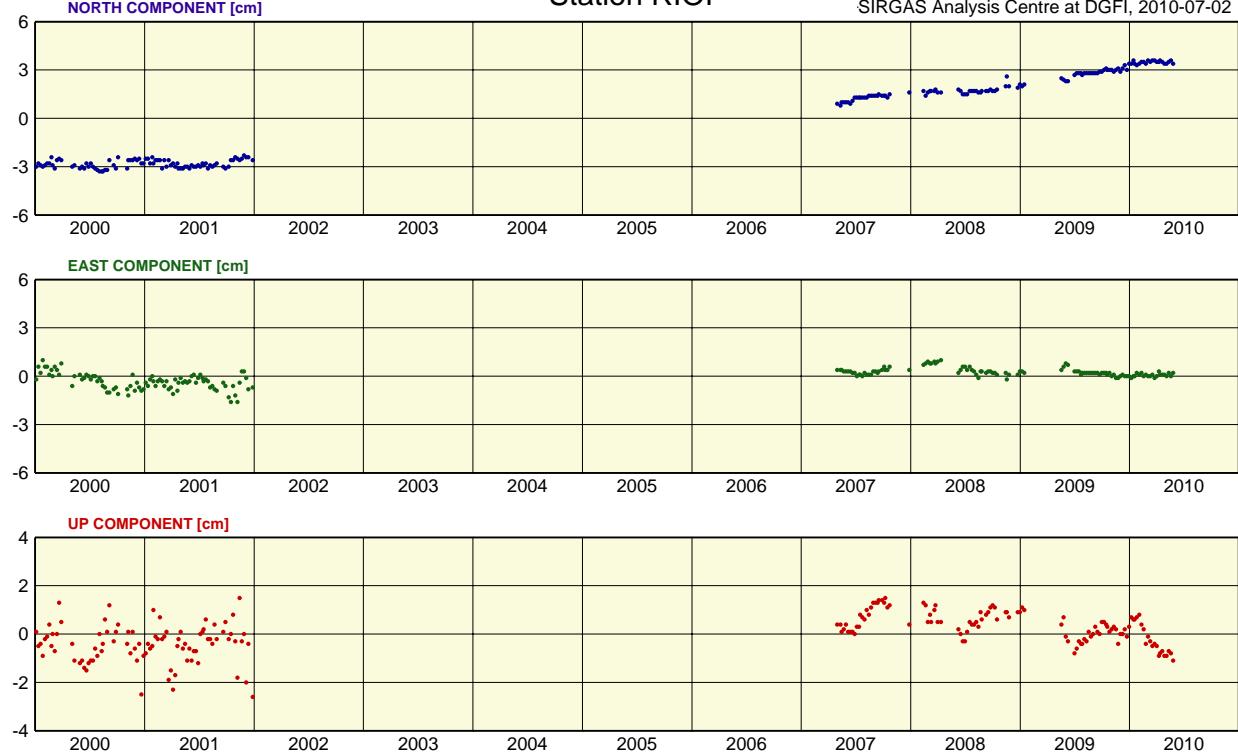

Station RJC

SIRGAS Analysis Centre at DGFI, 2010-07-02

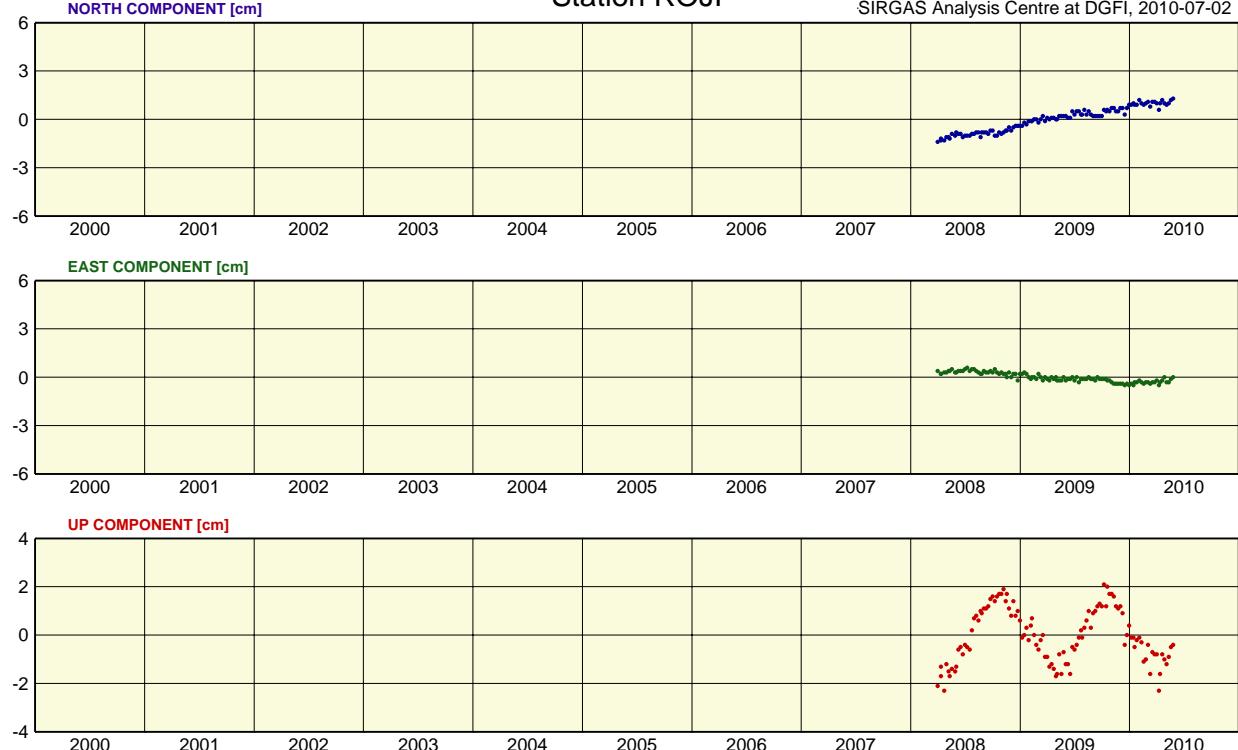

Station RIOP

SIRGAS Analysis Centre at DGFI, 2010-07-02

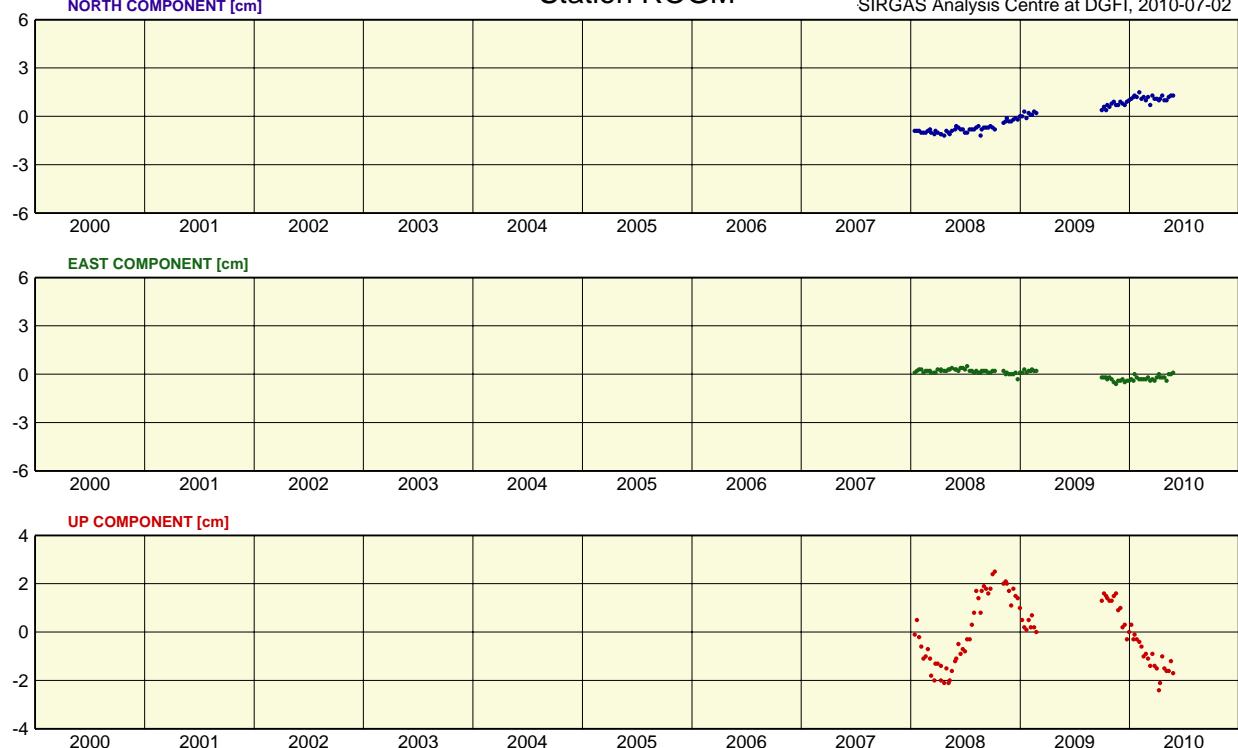

Station ROJI

SIRGAS Analysis Centre at DGFI, 2010-07-02

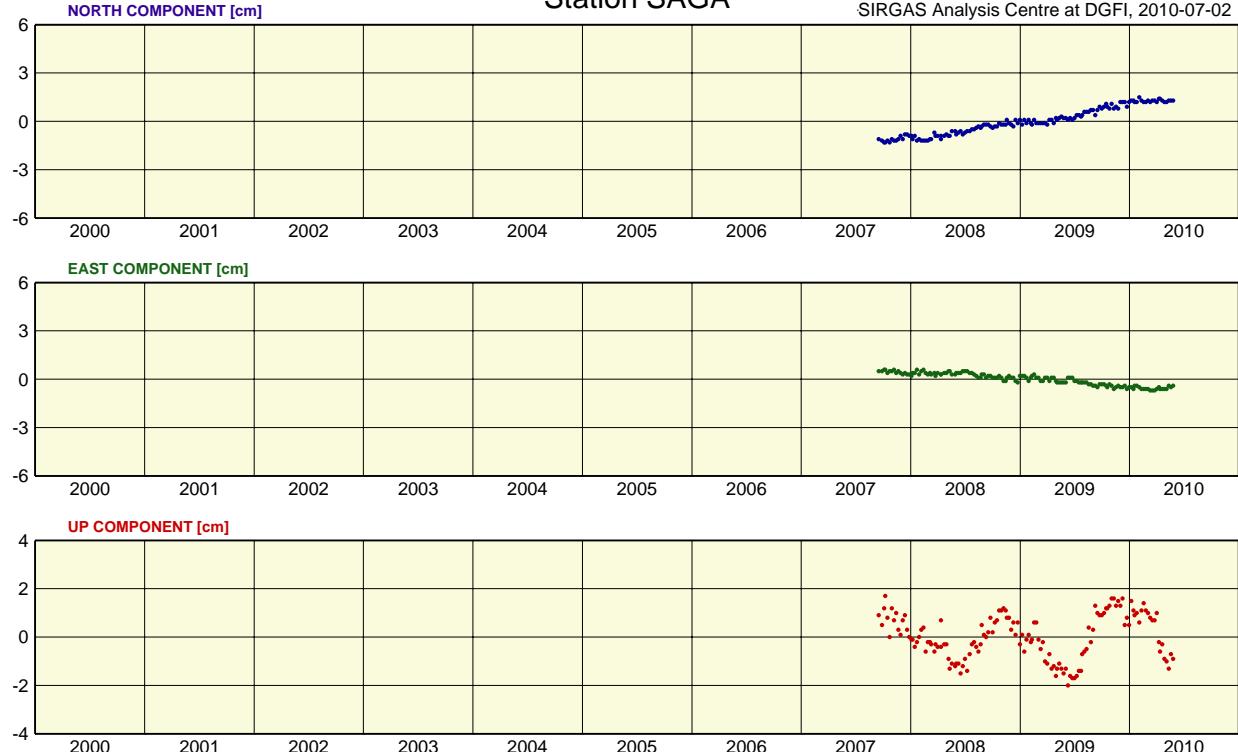

Station ROGM

SIRGAS Analysis Centre at DGFI, 2010-07-02

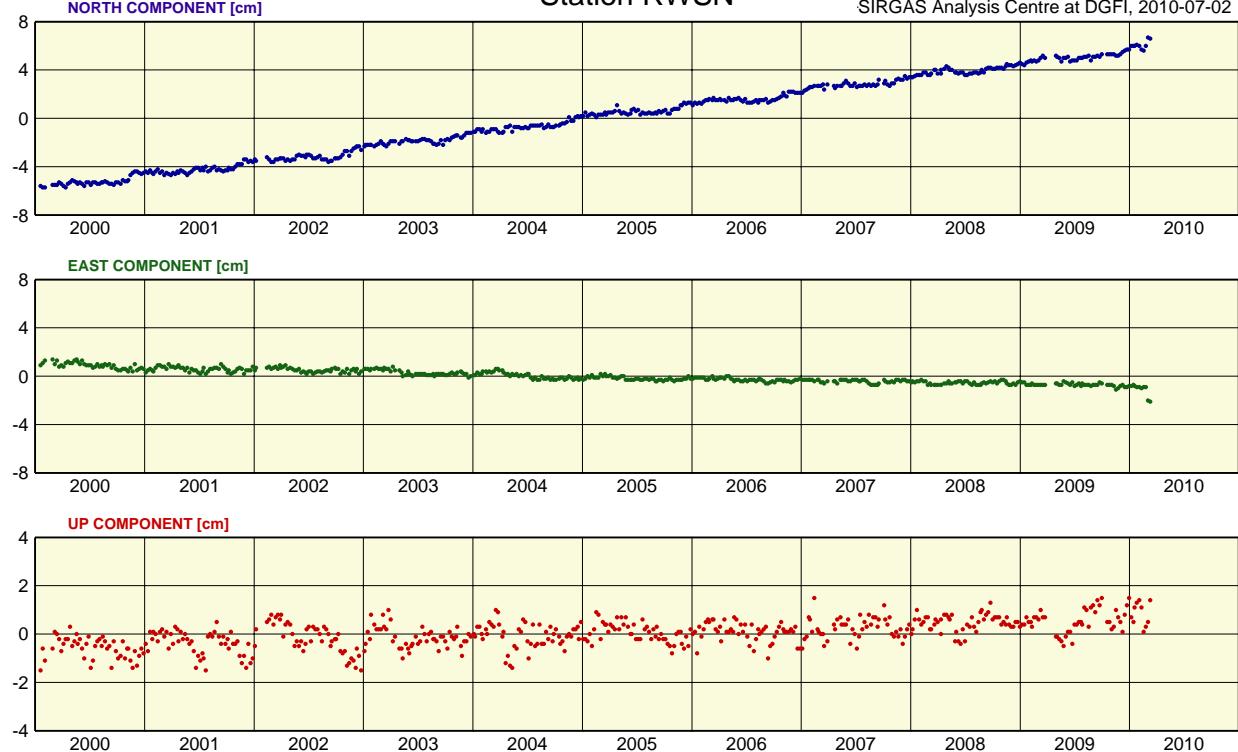

Station SAGA

SIRGAS Analysis Centre at DGFI, 2010-07-02

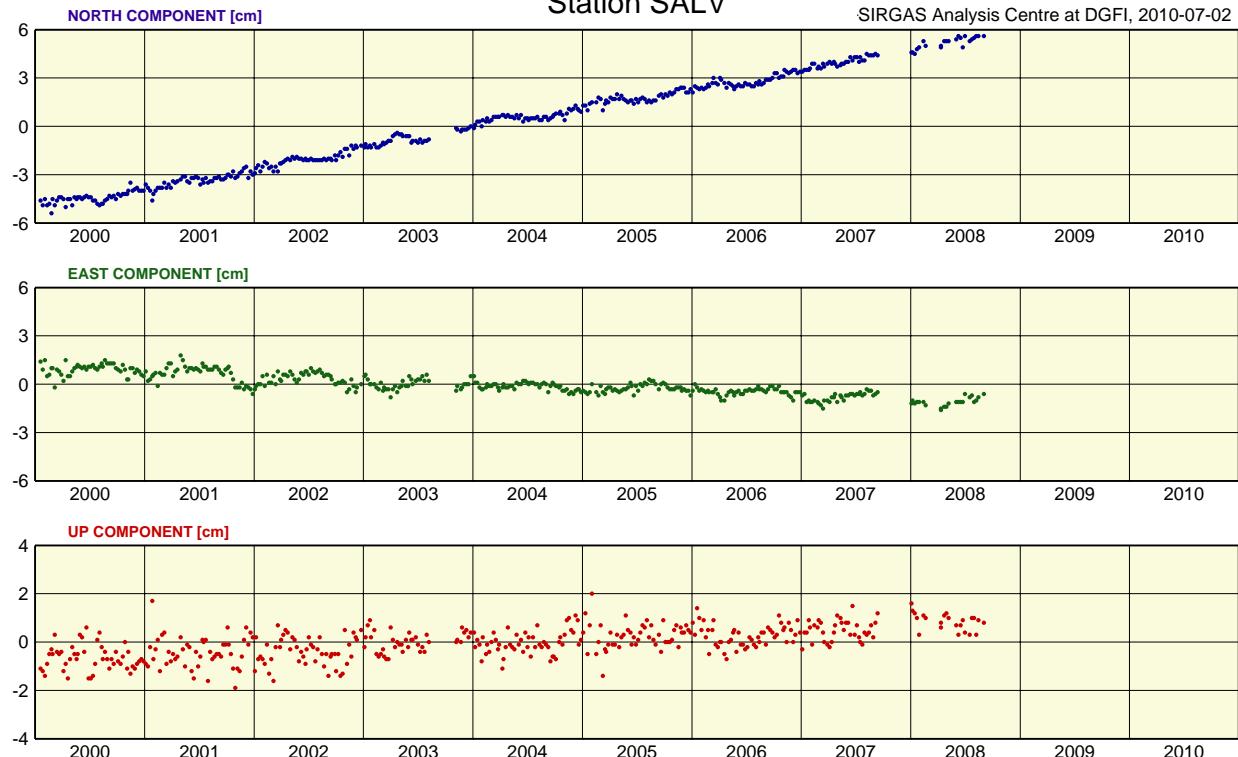

Station RWSN

SIRGAS Analysis Centre at DGFI, 2010-07-02

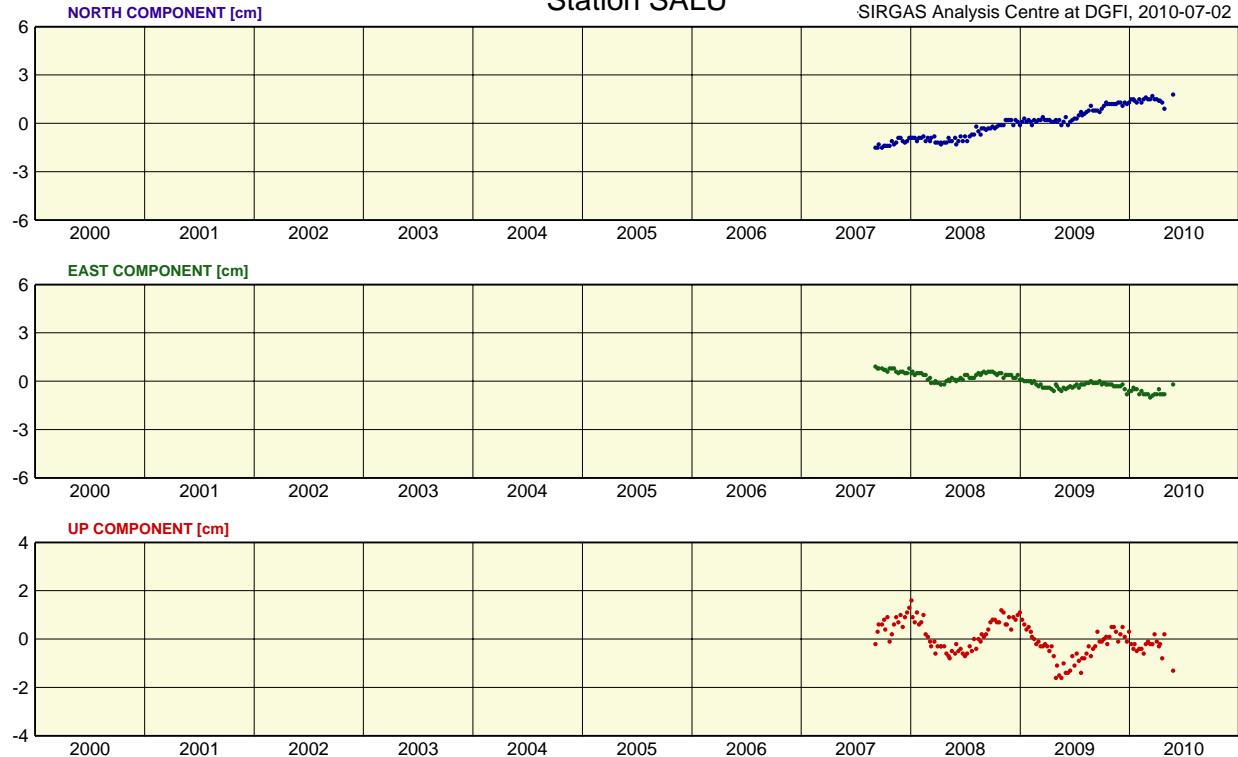

Station SALV

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station SALU

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station SANT

SIRGAS Analysis Centre at DGFI, 2010-07-02

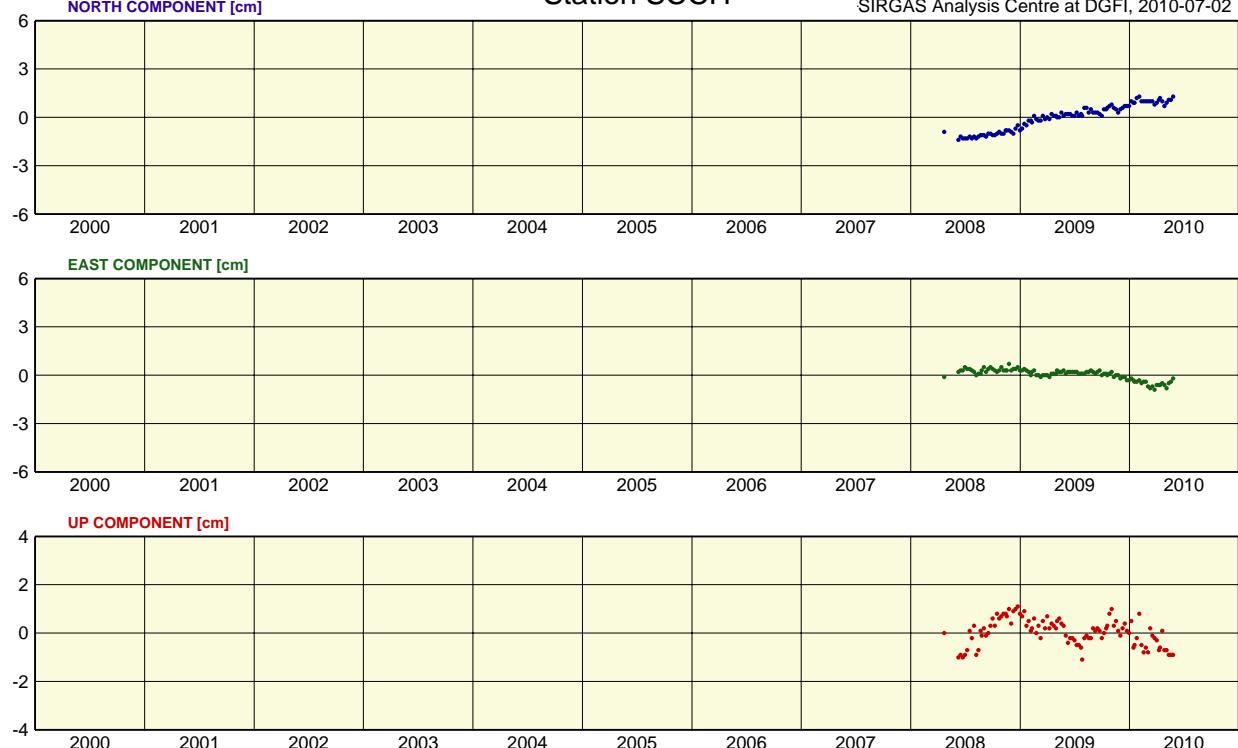

Station SAMA

SIRGAS Analysis Centre at DGFI, 2010-07-02

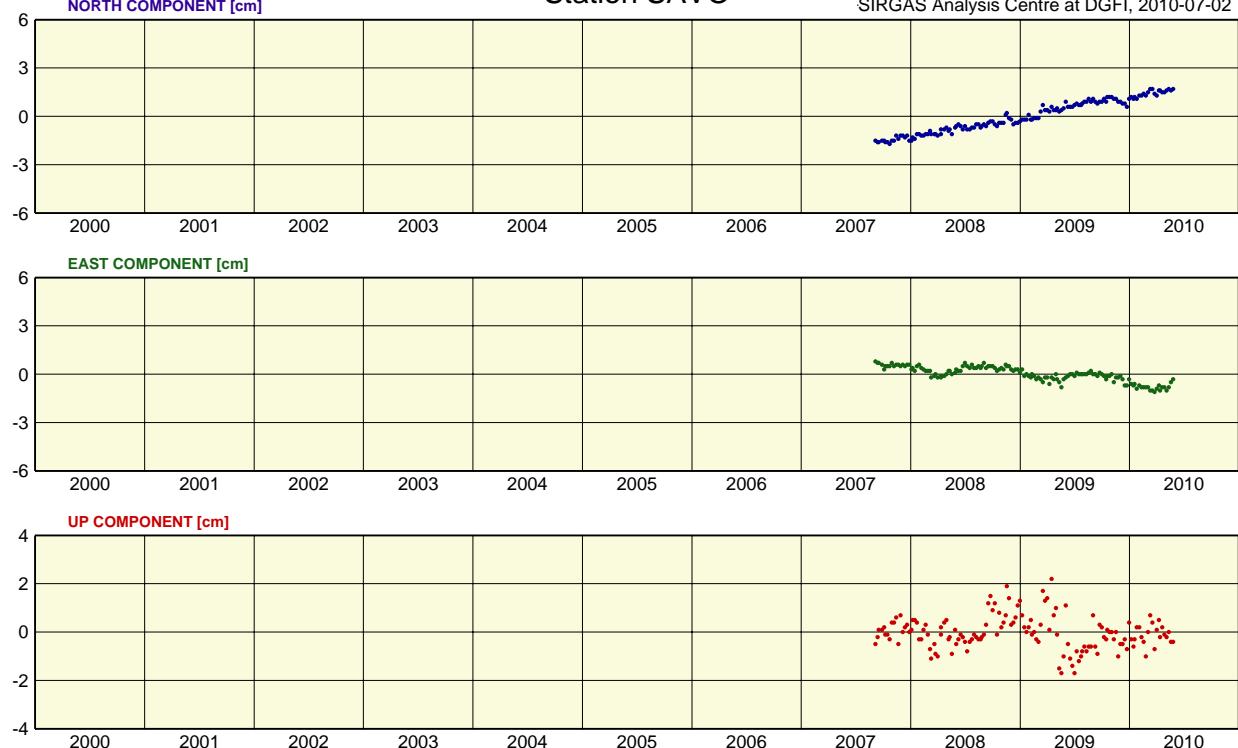

Station SCCH

SIRGAS Analysis Centre at DGFI, 2010-07-02

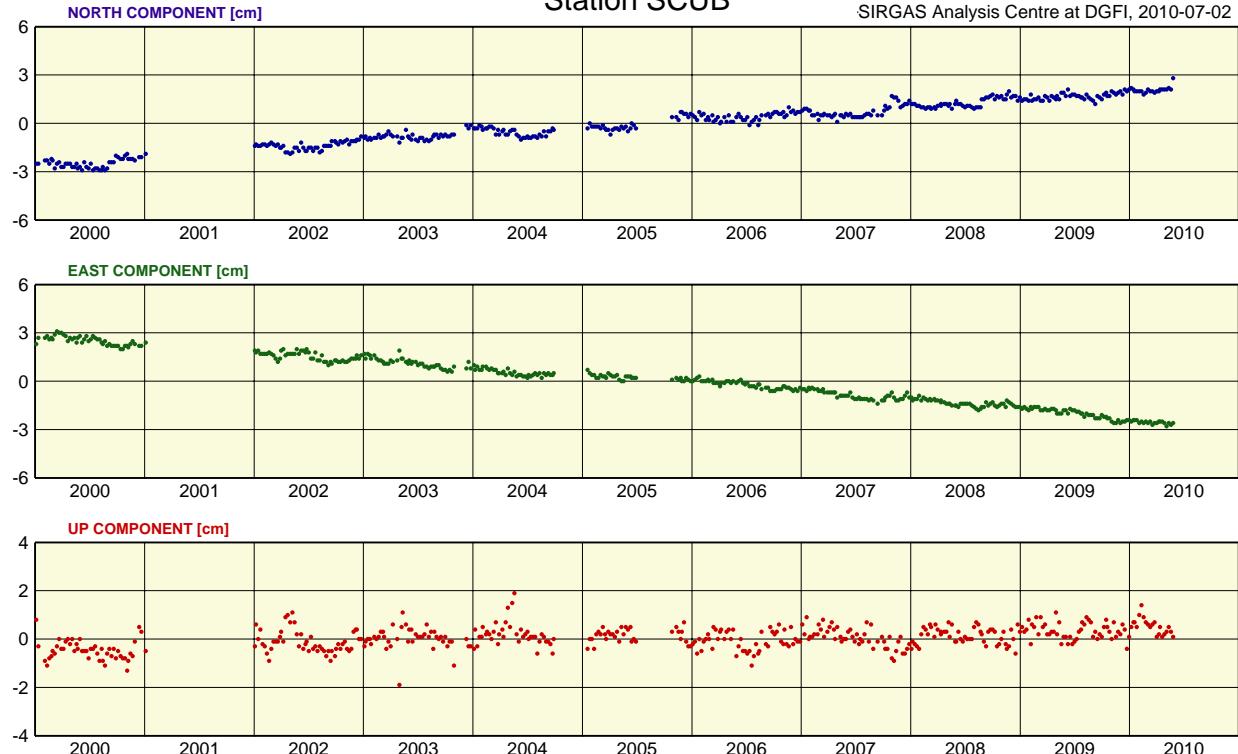

Station SAVO

SIRGAS Analysis Centre at DGFI, 2010-07-02

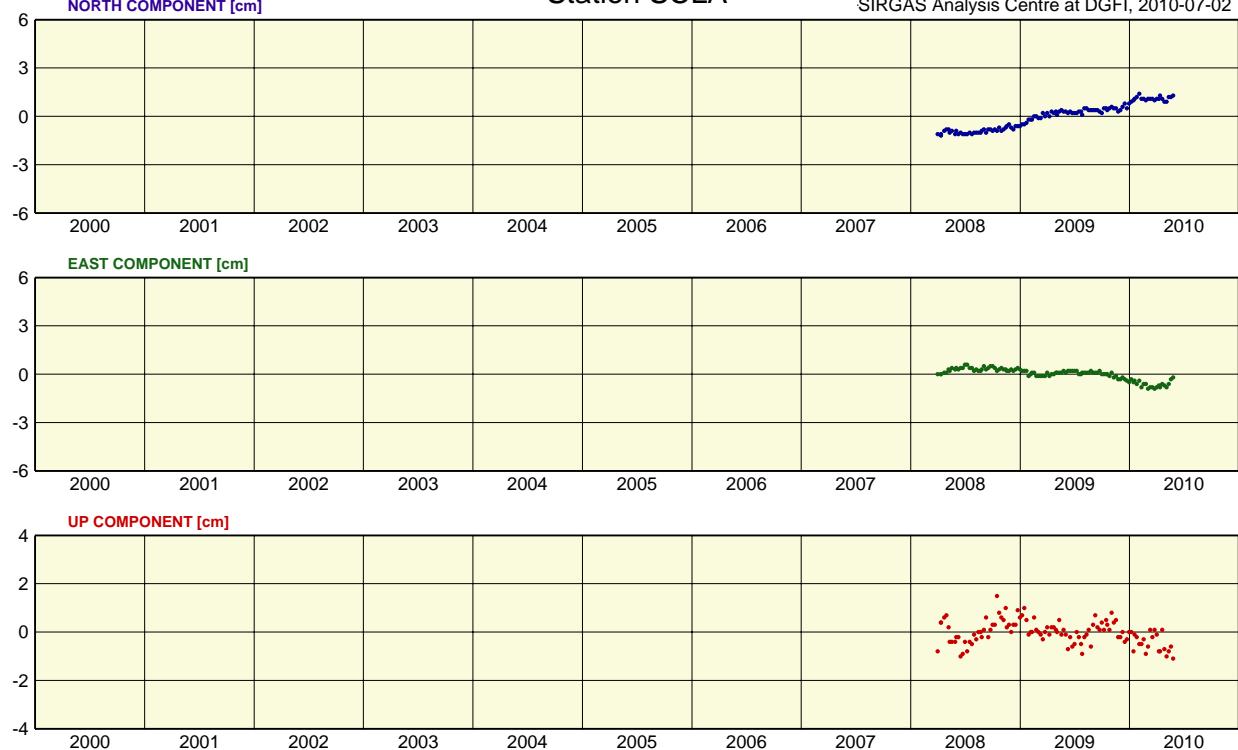

Station SCUB

SIRGAS Analysis Centre at DGFI, 2010-07-02

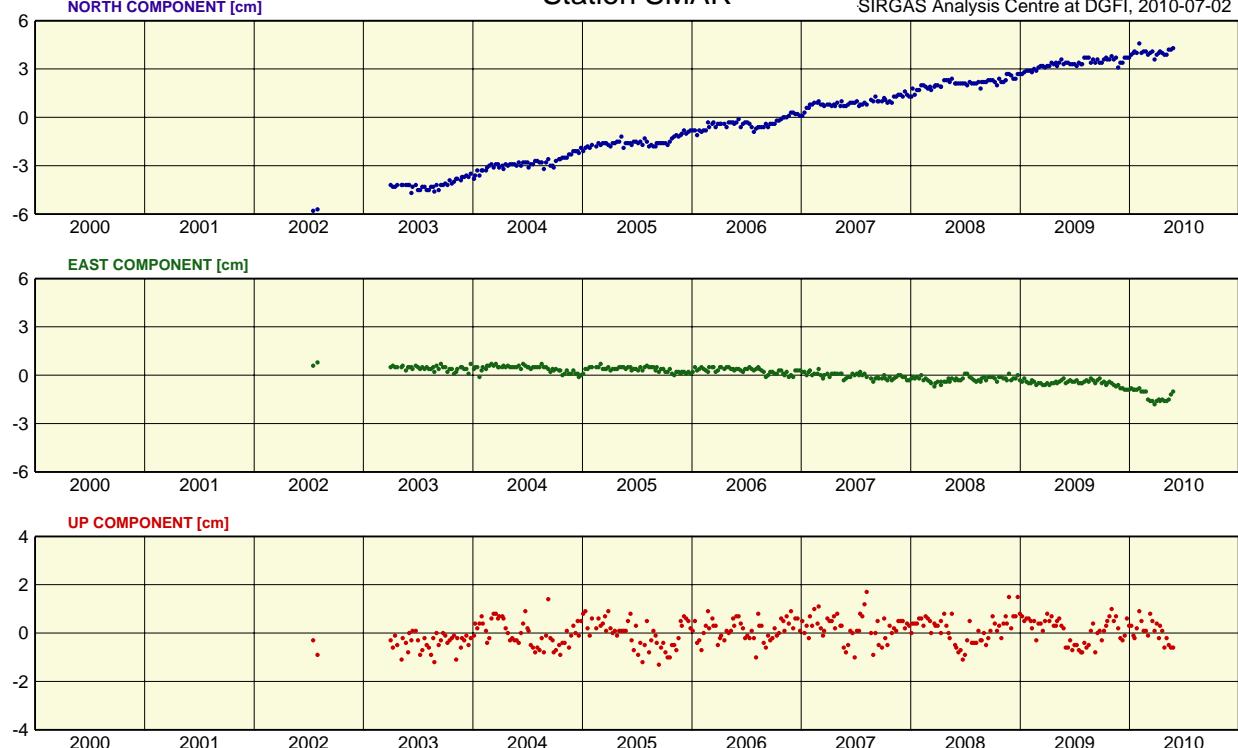

Station SCLA

SIRGAS Analysis Centre at DGFI, 2010-07-02

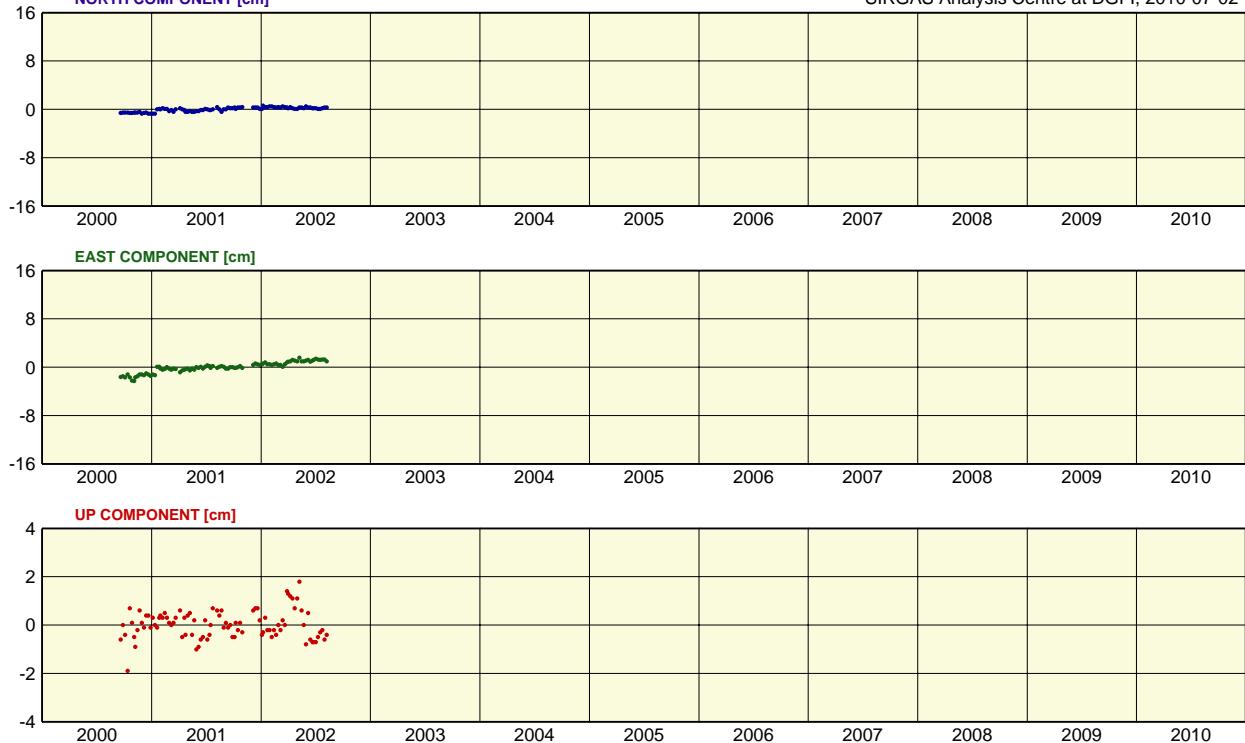

Station SMAR

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station SLOR

SIRGAS Analysis Centre at DGFI, 2010-07-02

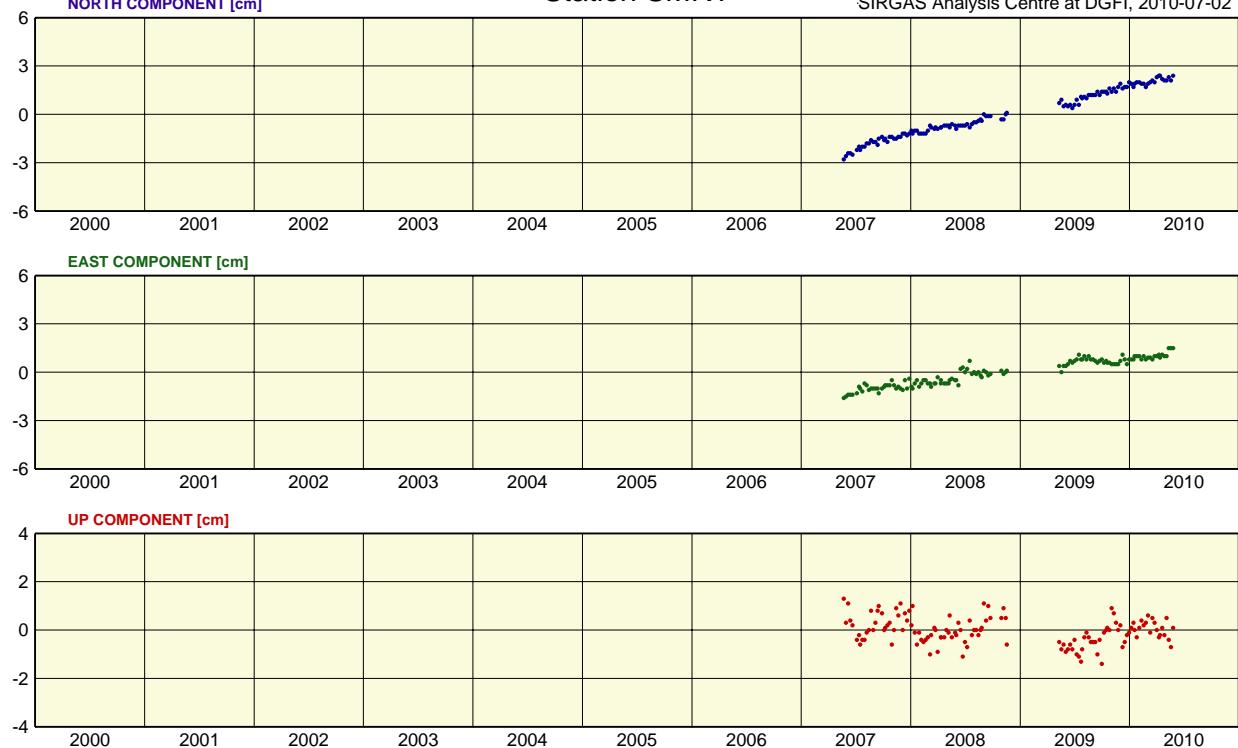

Station SRNW

SIRGAS Analysis Centre at DGFI, 2010-07-02

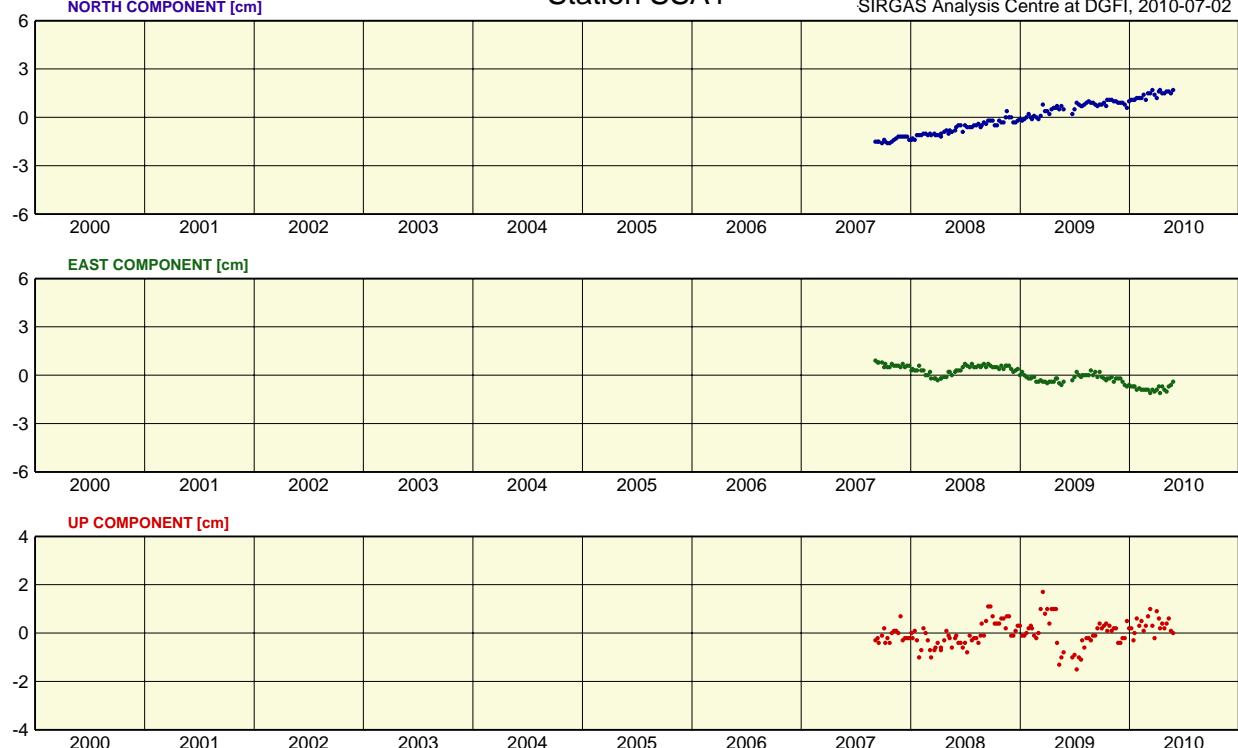

Station SMRT

SIRGAS Analysis Centre at DGFI, 2010-07-02

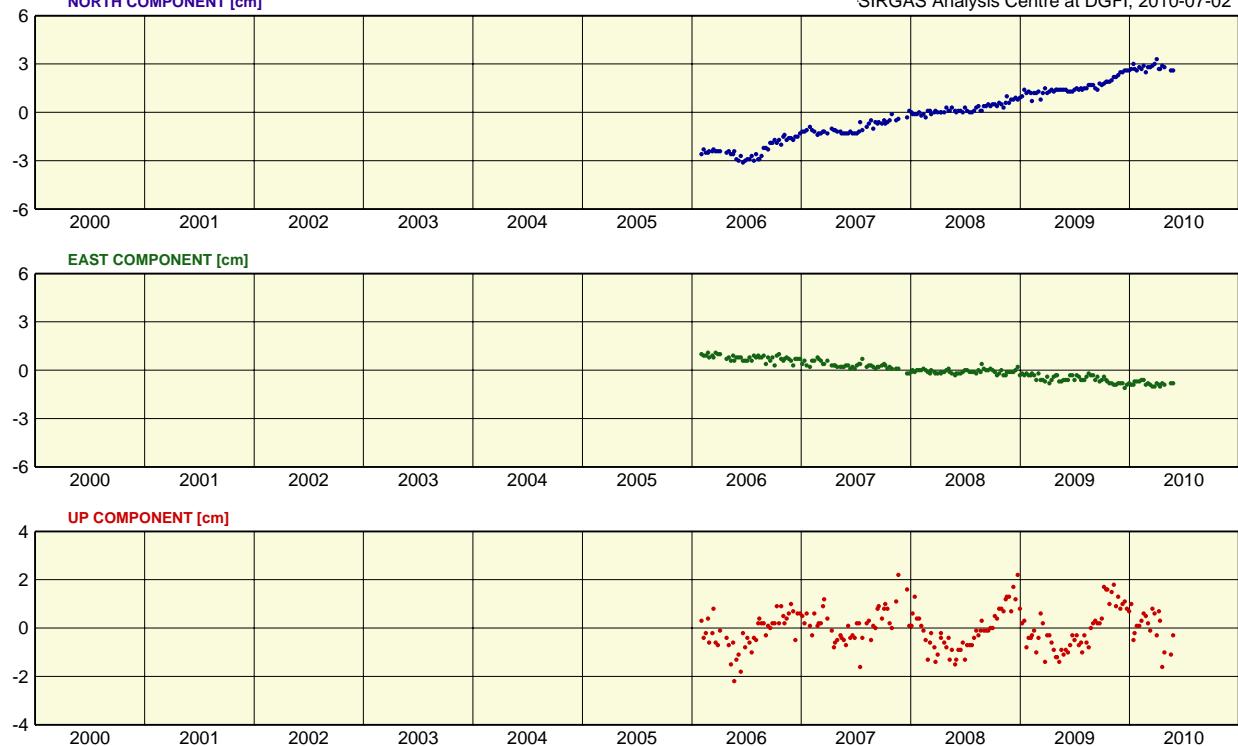

Station SSA1

SIRGAS Analysis Centre at DGFI, 2010-07-02

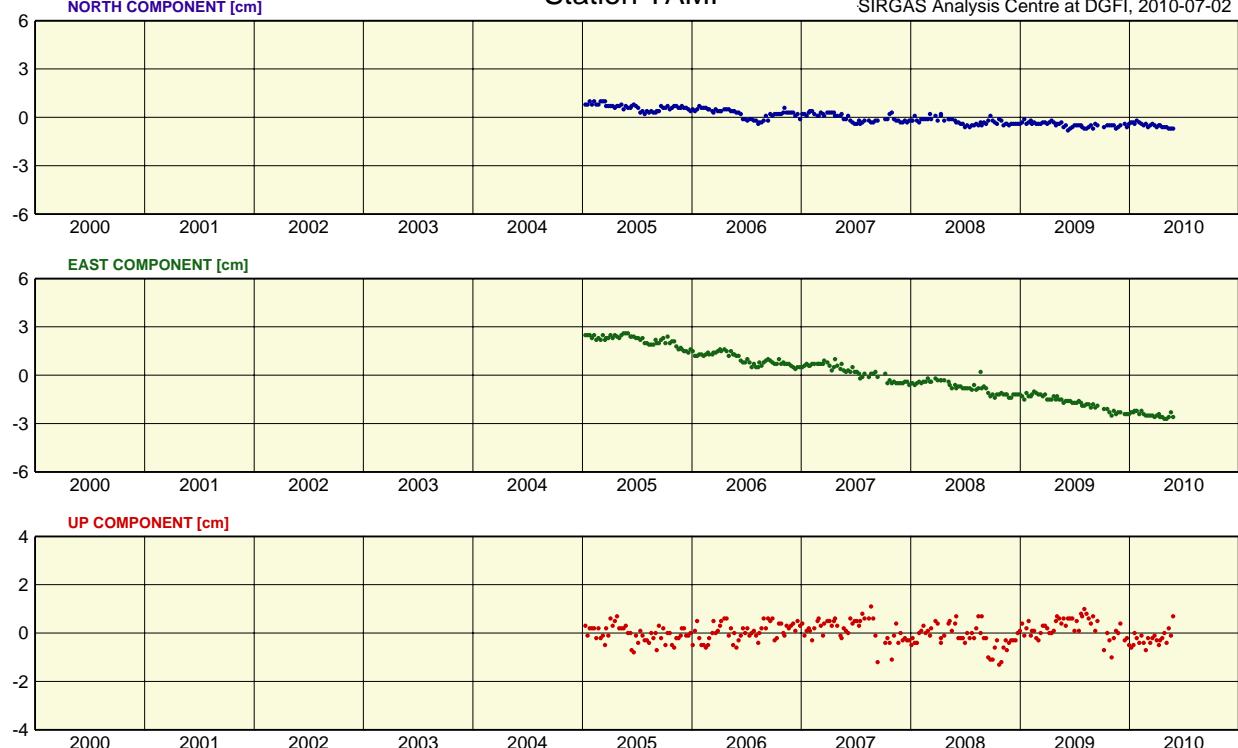

Station SRZN

SIRGAS Analysis Centre at DGFI, 2010-07-02

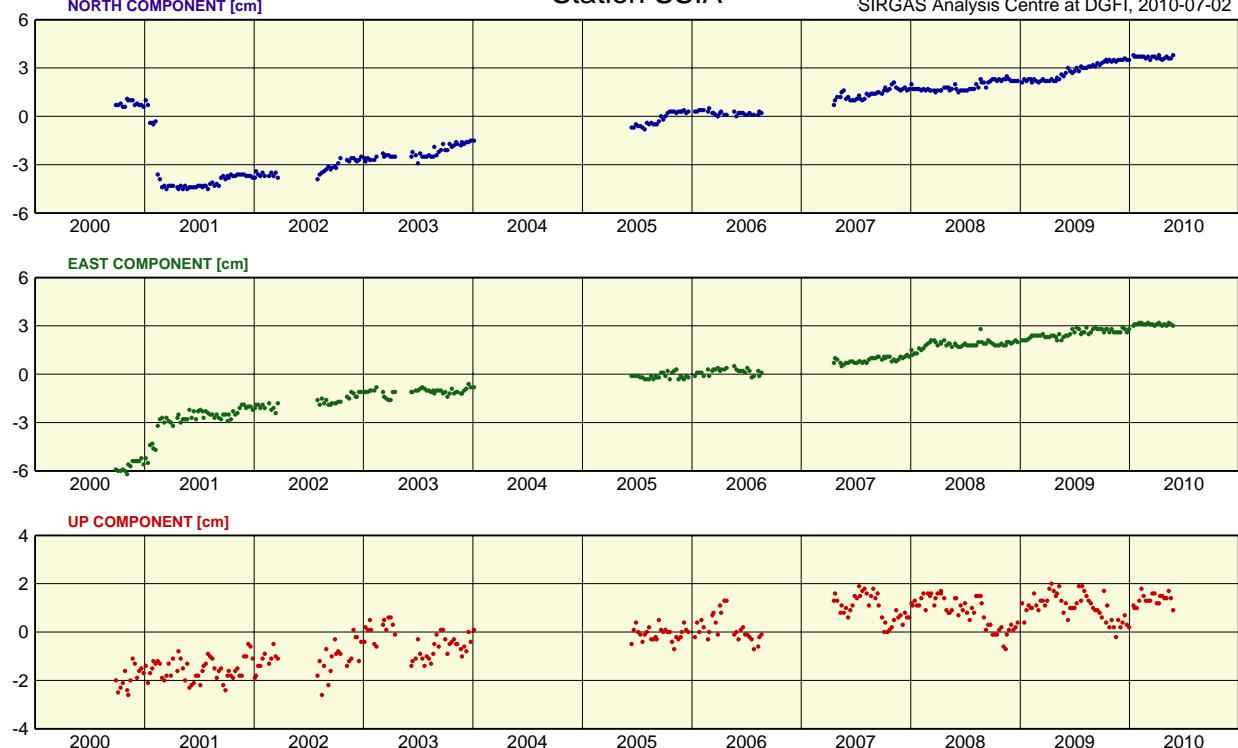

Station TAMP

SIRGAS Analysis Centre at DGFI, 2010-07-02

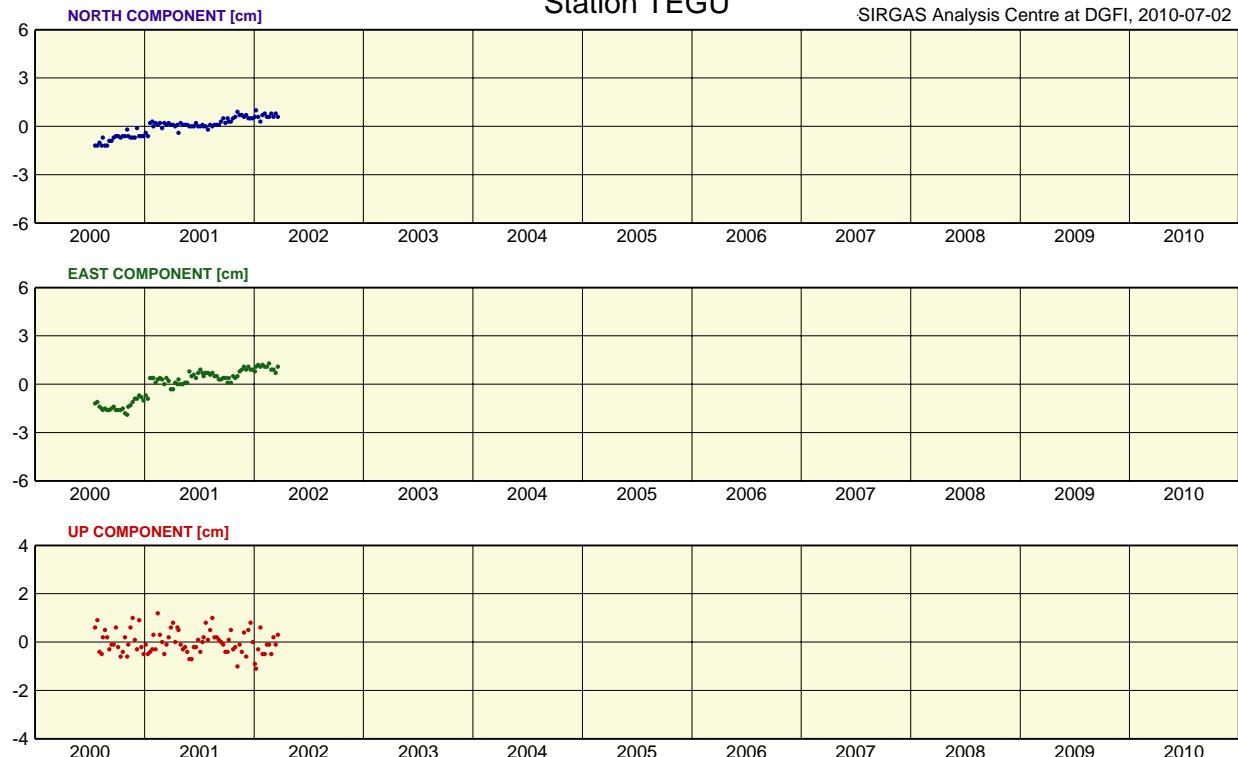

Station SSIA

SIRGAS Analysis Centre at DGFI, 2010-07-02

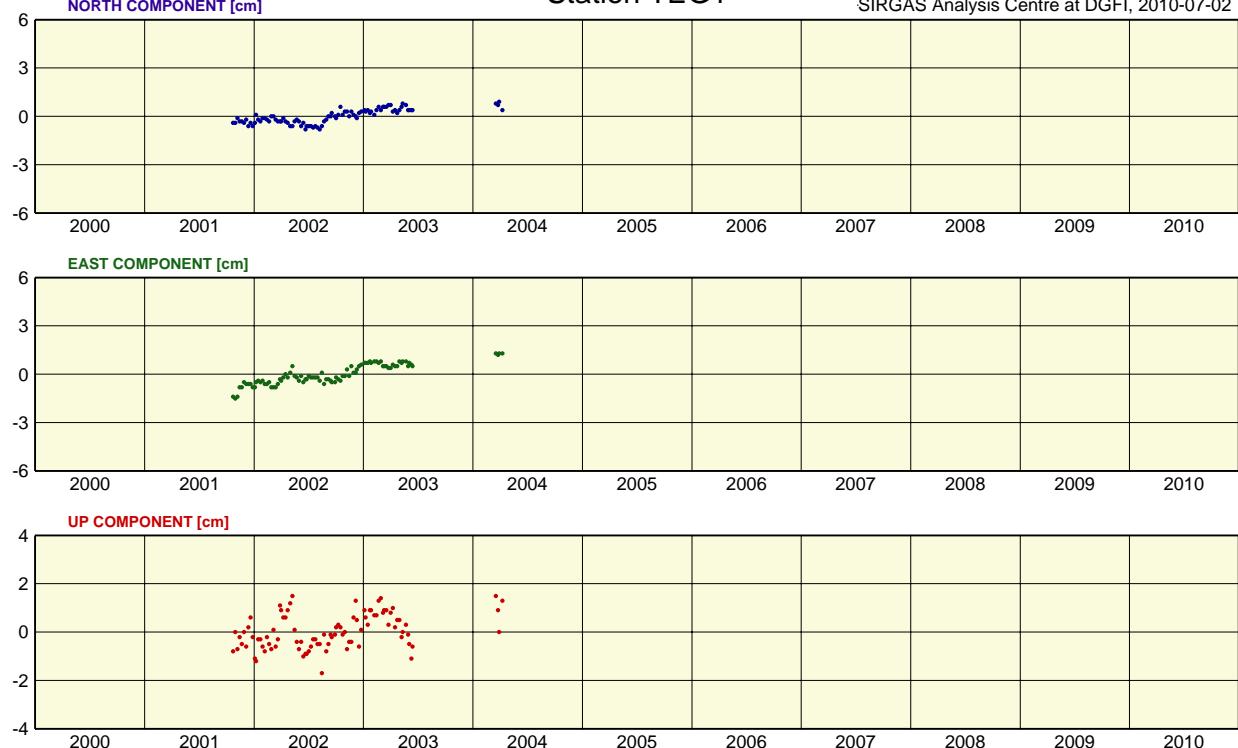

Station TEGU

SIRGAS Analysis Centre at DGFI, 2010-07-02

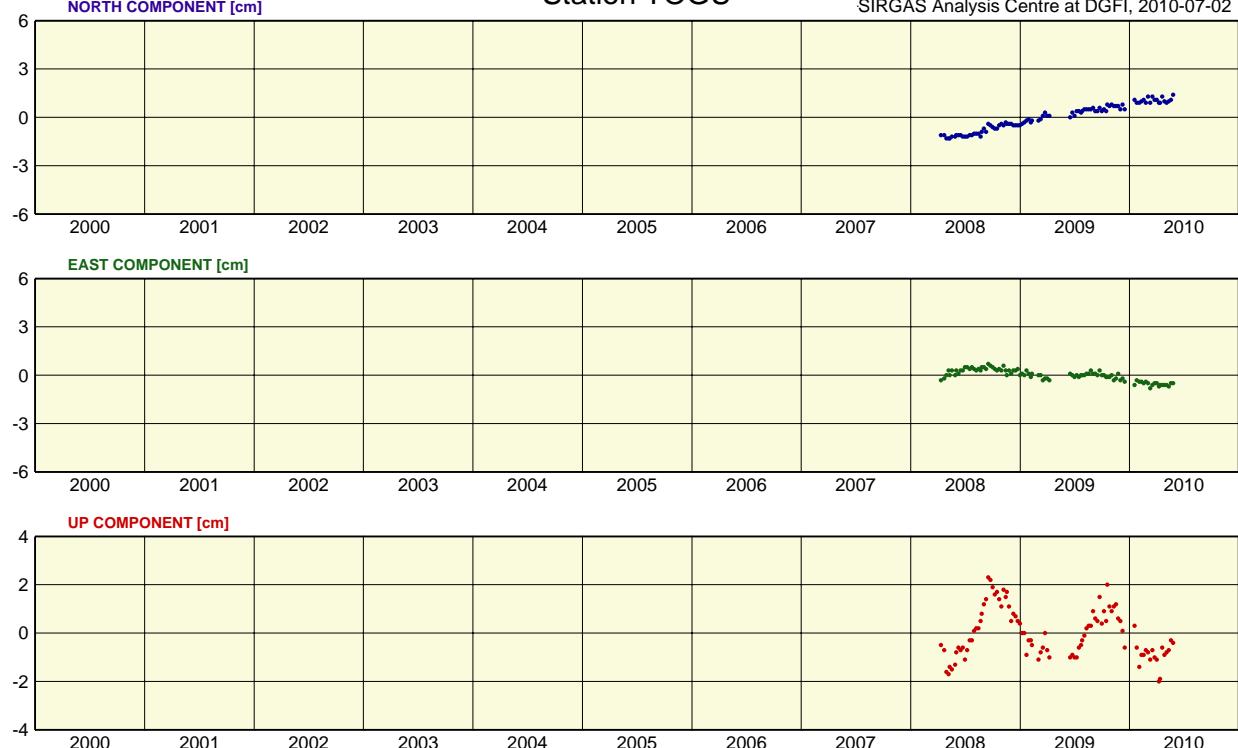

Station TEG1

SIRGAS Analysis Centre at DGFI, 2010-07-02

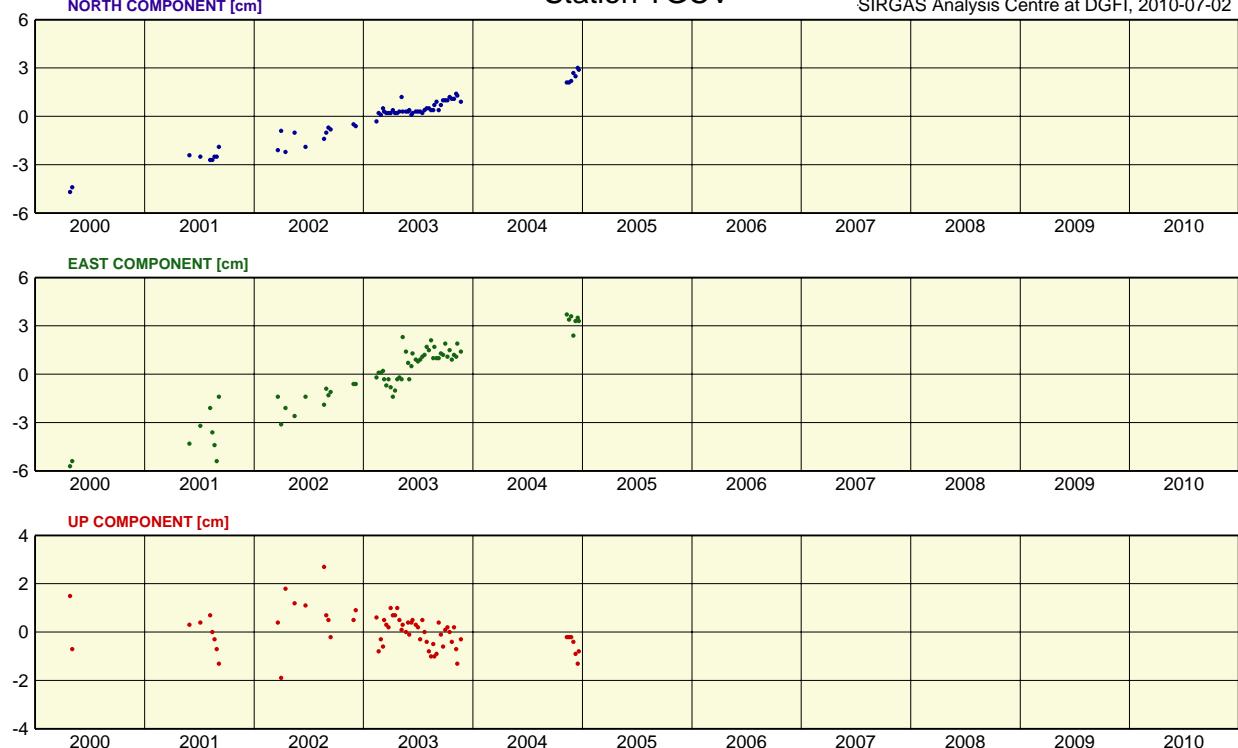

Station TOGU

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station TGCV

SIRGAS Analysis Centre at DGFI, 2010-07-02

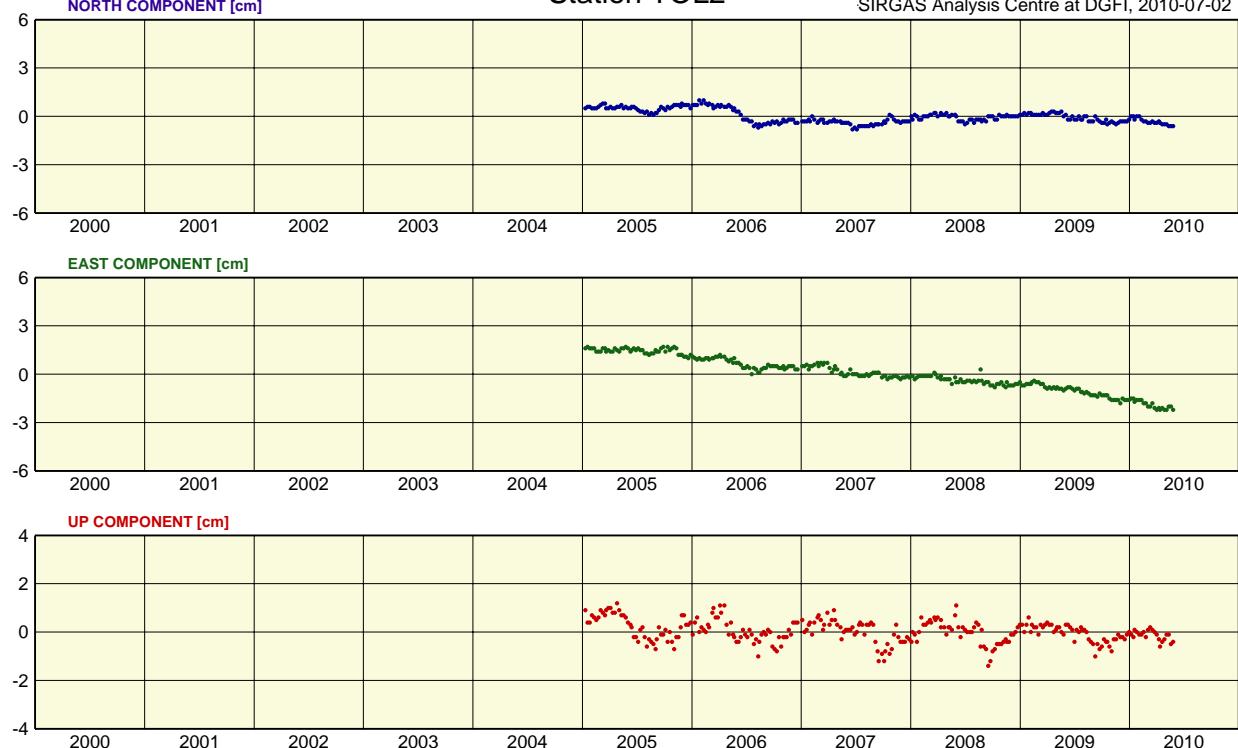

Station TOPL

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station TOL2

SIRGAS Analysis Centre at DGFI, 2010-07-02

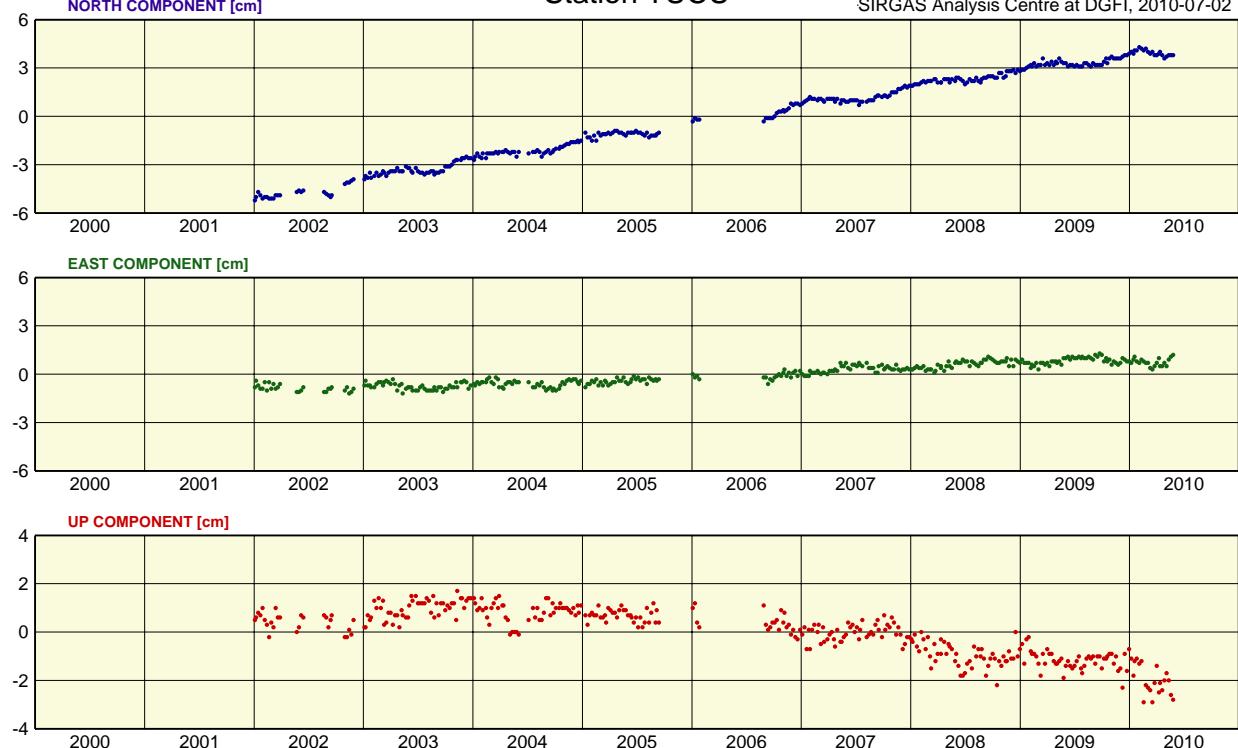

Station TUNA

SIRGAS Analysis Centre at DGFI, 2010-07-02

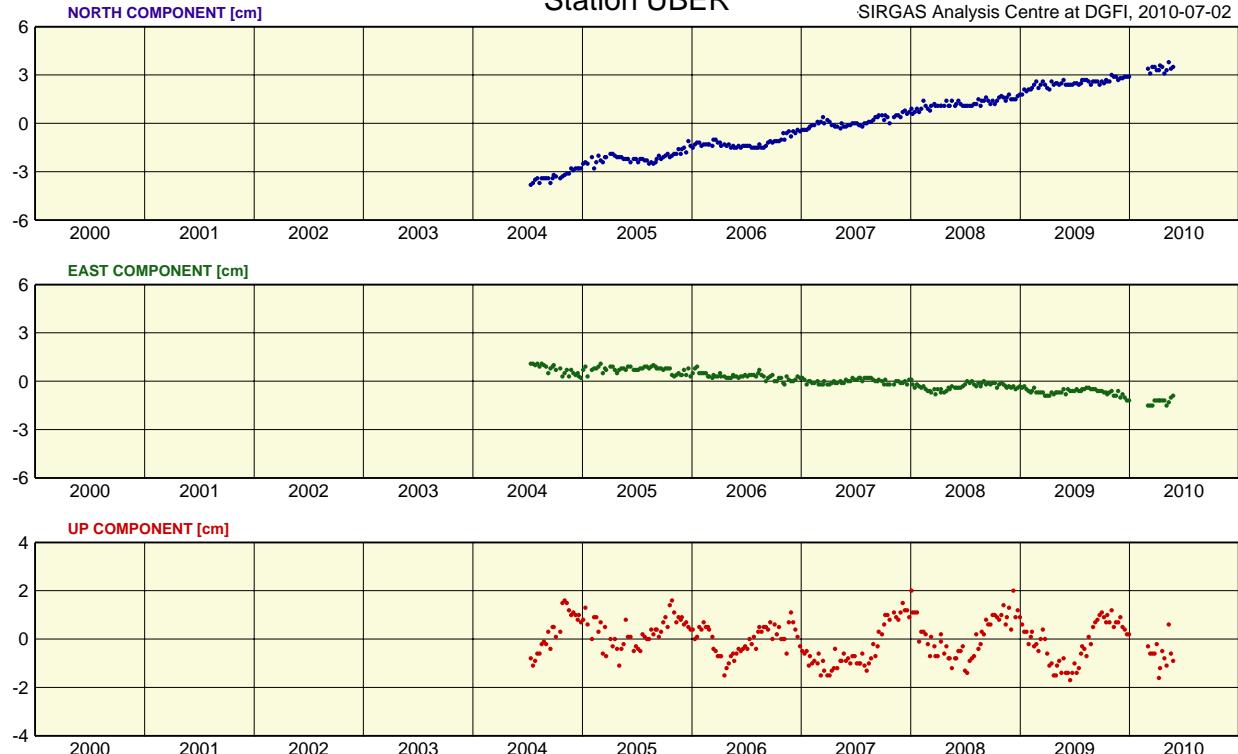

Station TUCU

SIRGAS Analysis Centre at DGFI, 2010-07-02

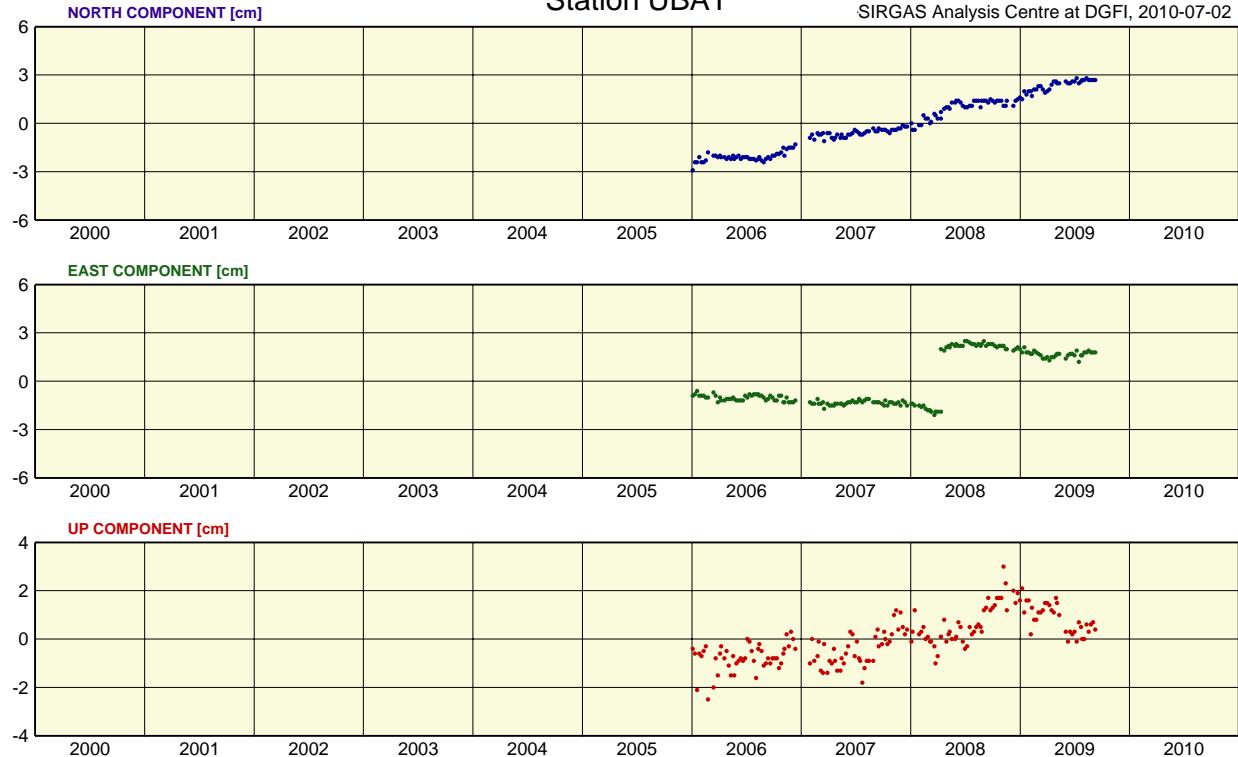

Station UBER

SIRGAS Analysis Centre at DGFI, 2010-07-02

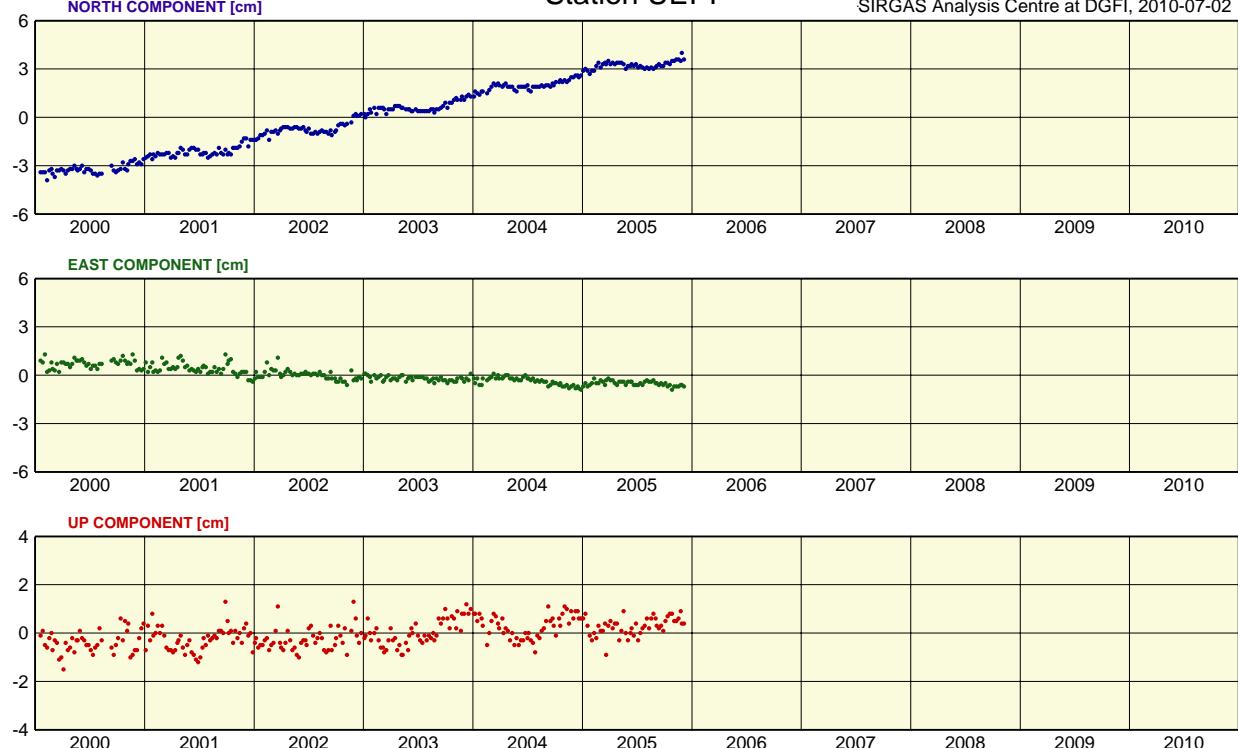

Station UBAT

SIRGAS Analysis Centre at DGFI, 2010-07-02

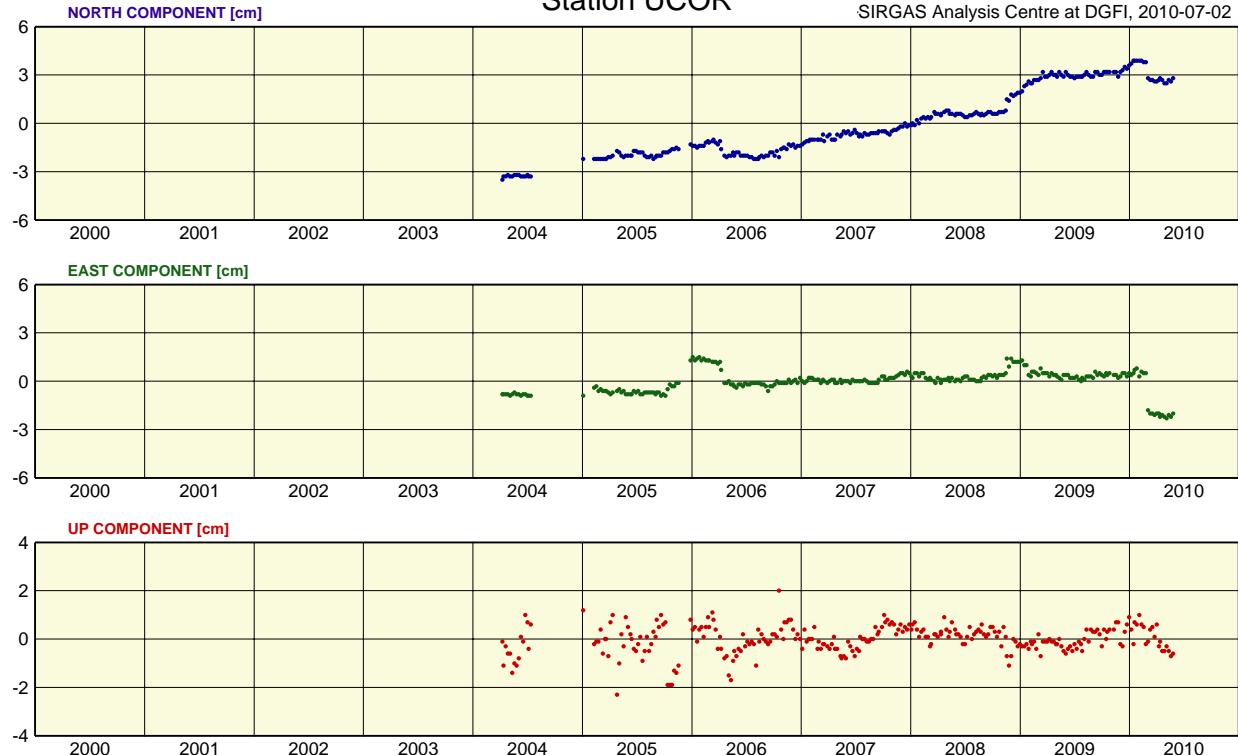

Station UEPP

SIRGAS Analysis Centre at DGFI, 2010-07-02

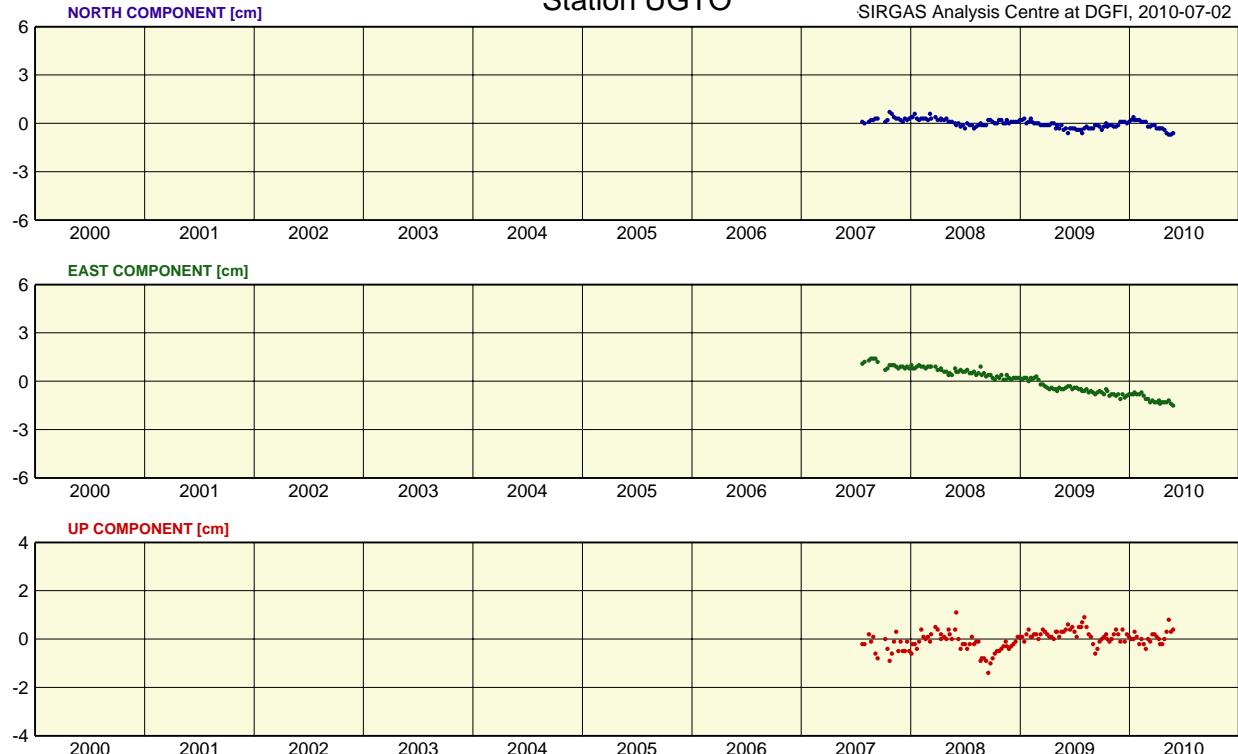

Station UCOR

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station UGTO

SIRGAS Analysis Centre at DGFI, 2010-07-02

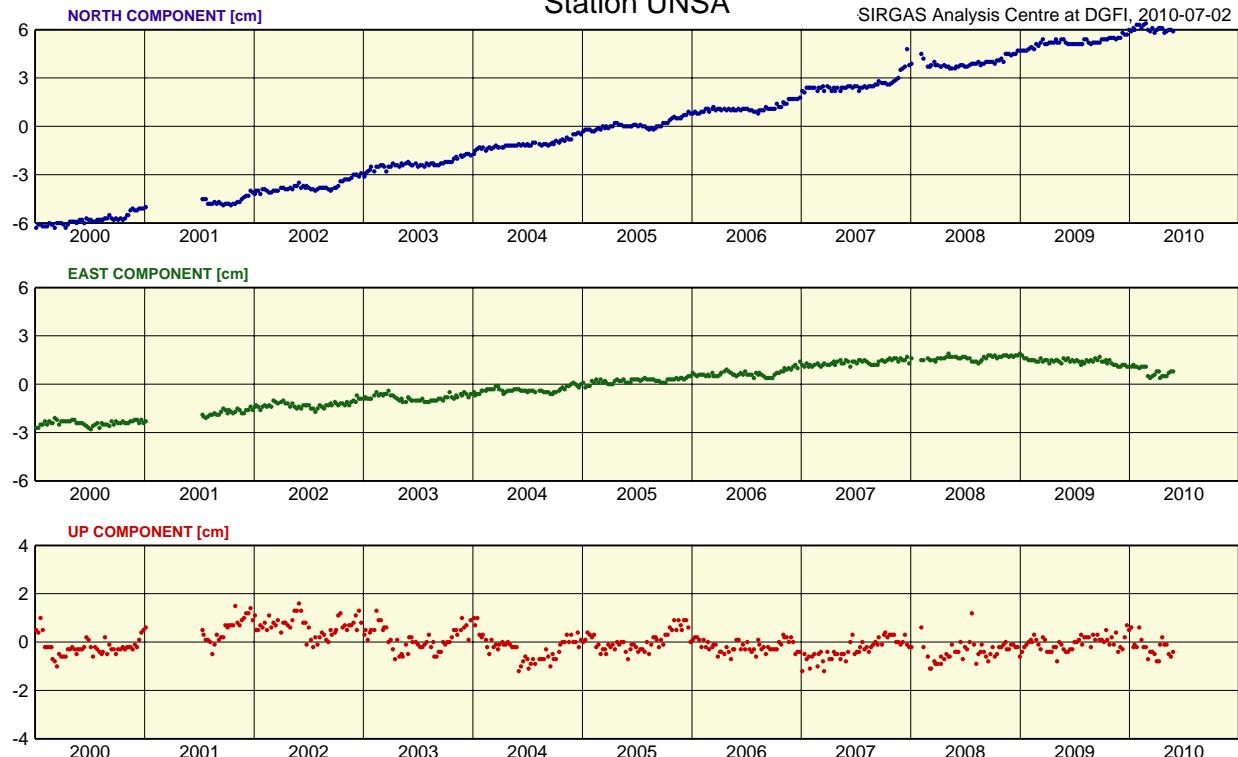

Station UFPR

SIRGAS Analysis Centre at DGFI, 2010-07-02

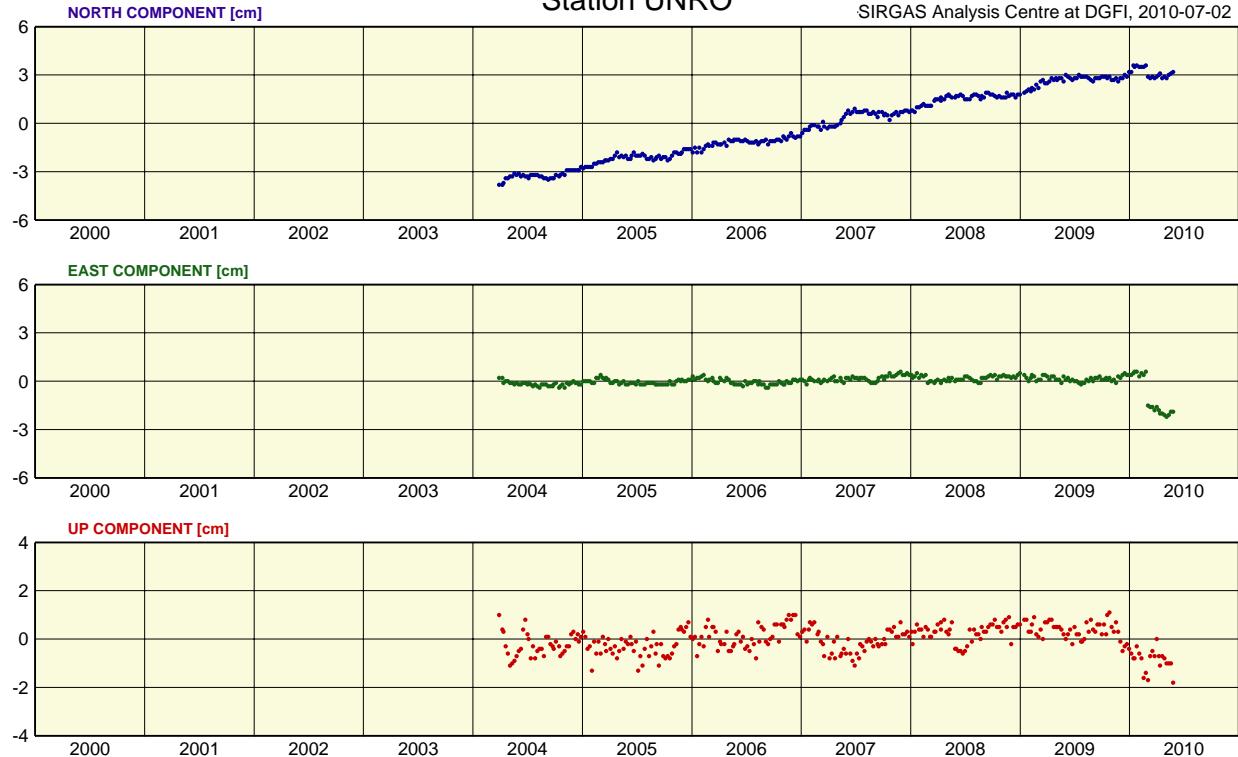

Station UNSA

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station UNRO

SIRGAS Analysis Centre at DGFI, 2010-07-02

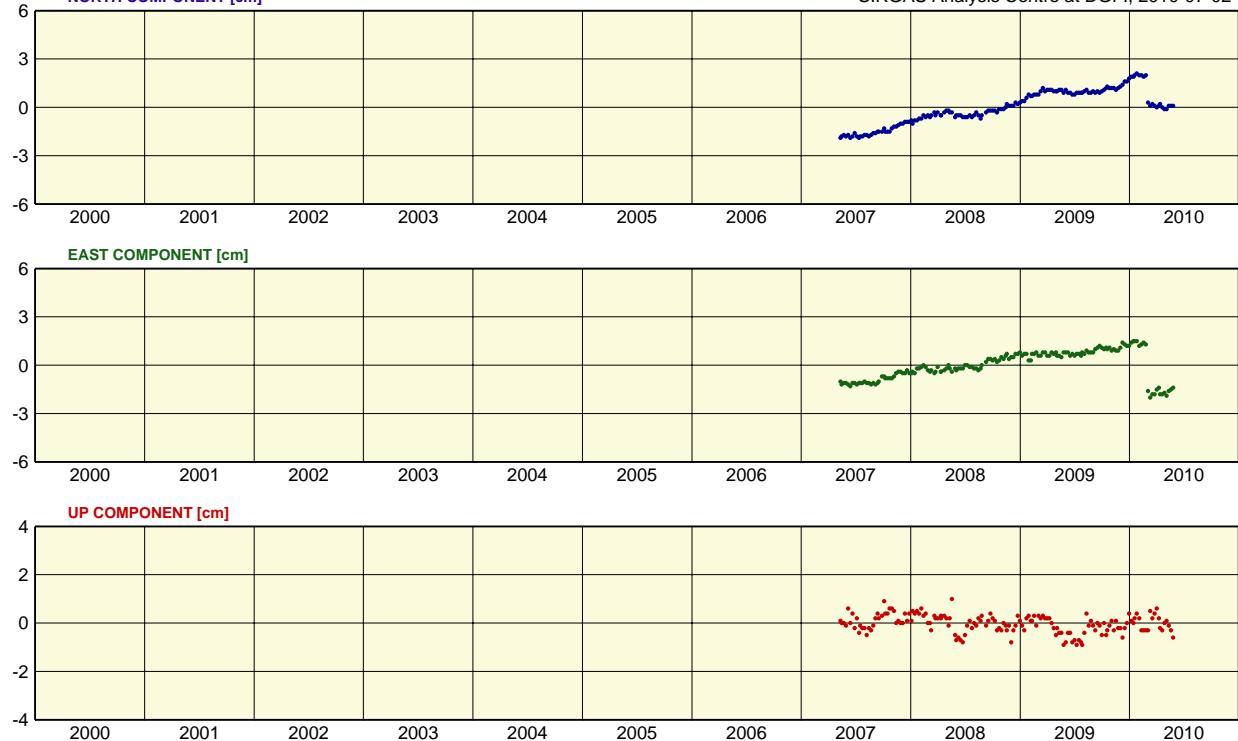

Station USLP

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station UNSJ

SIRGAS Analysis Centre at DGFI, 2010-07-02

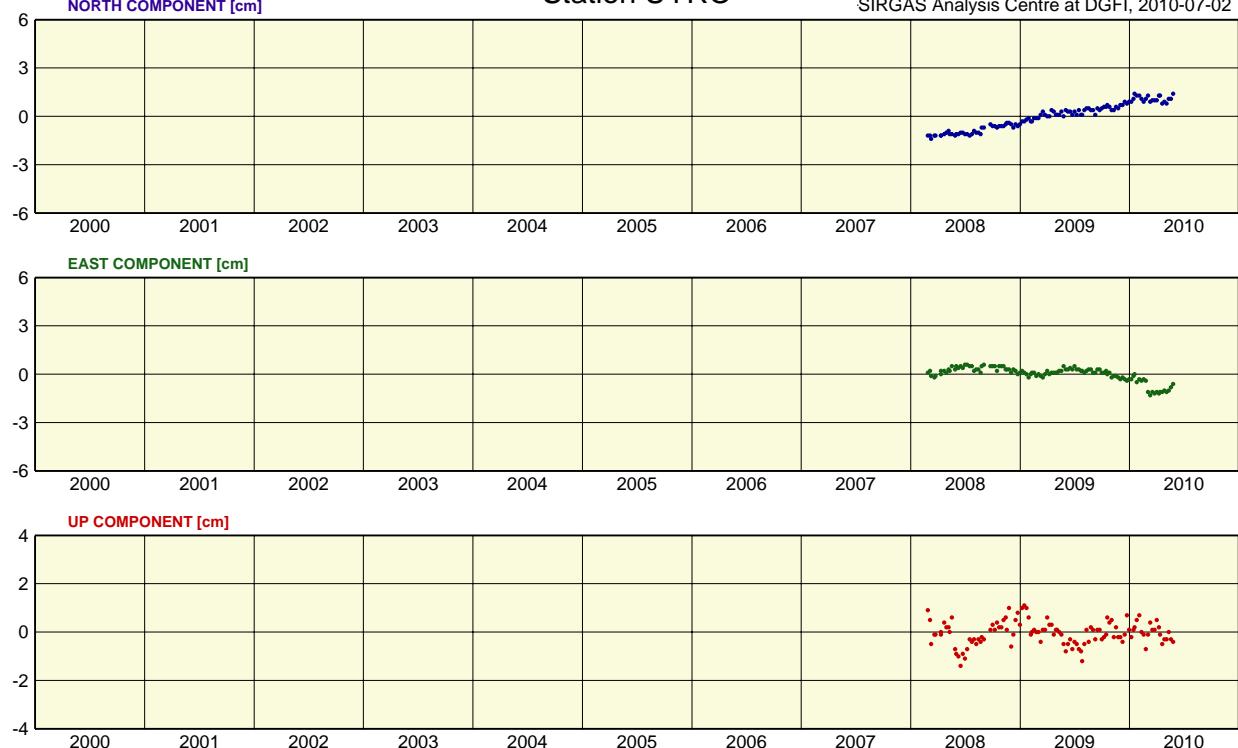

Station VALL

SIRGAS Analysis Centre at DGFI, 2010-07-02

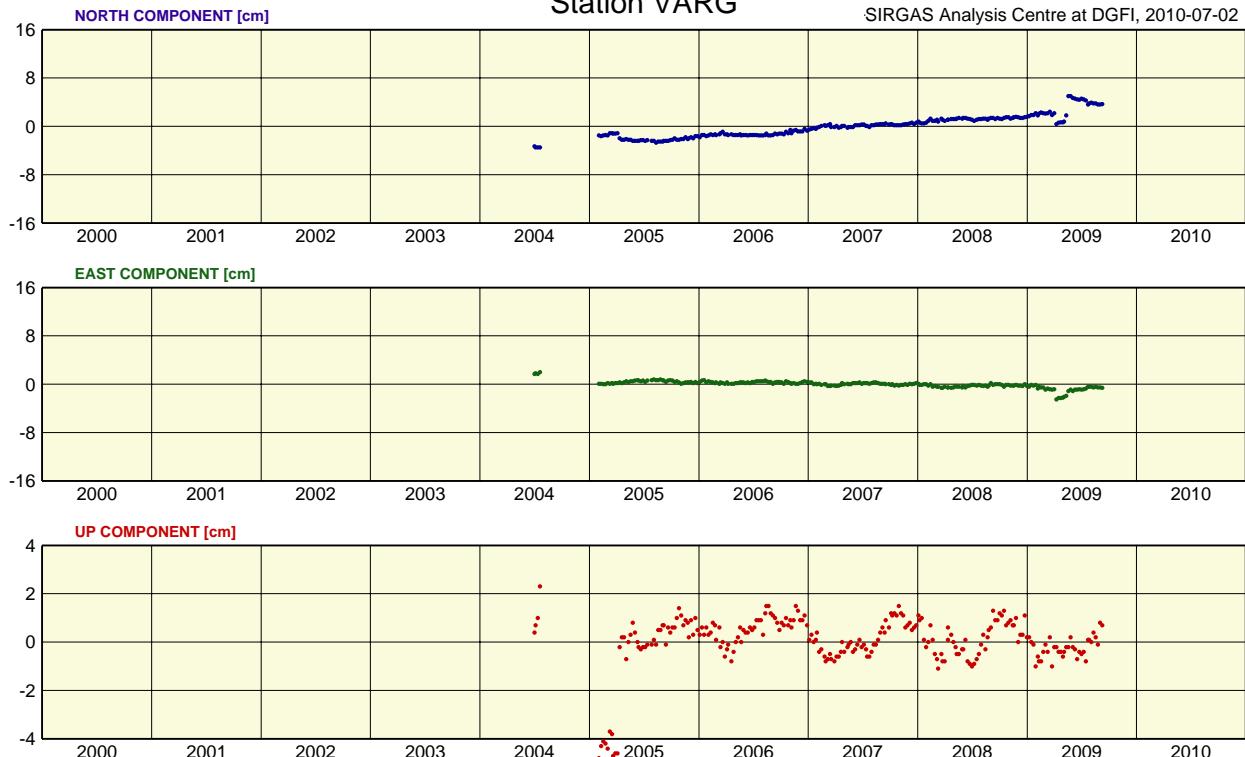

Station UYRO

SIRGAS Analysis Centre at DGFI, 2010-07-02

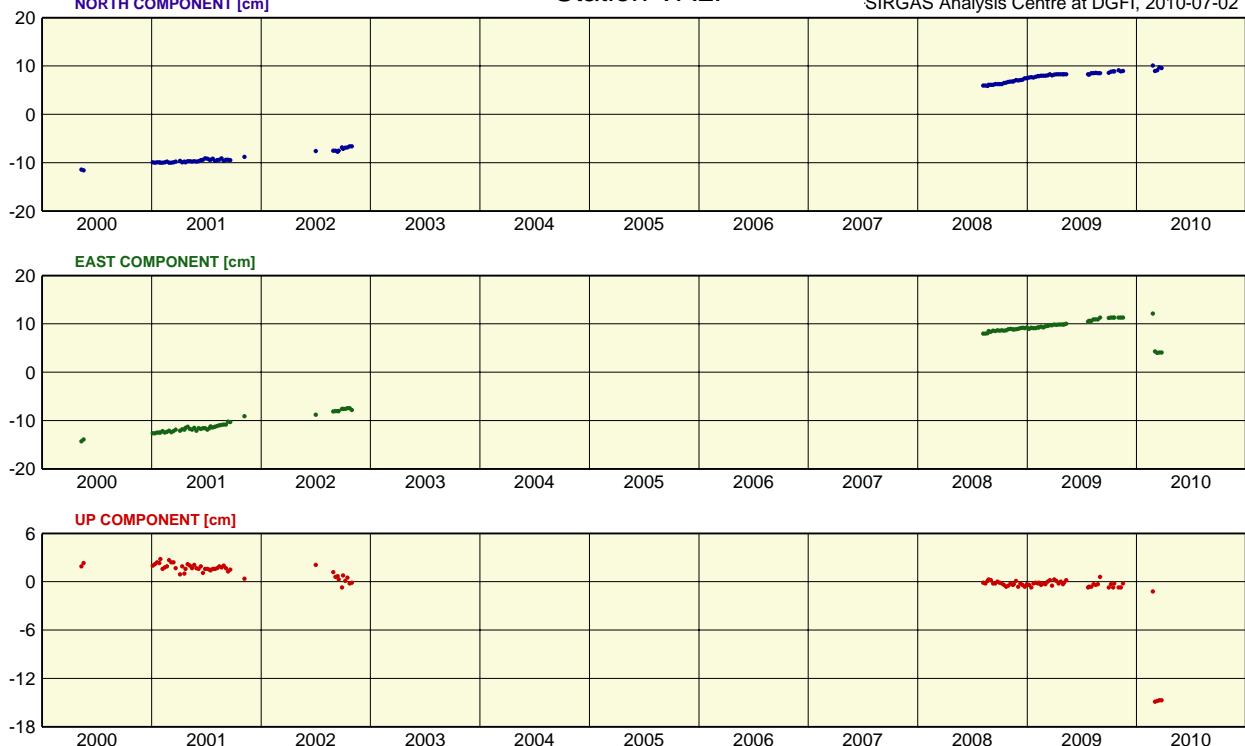

Station VARG

SIRGAS Analysis Centre at DGFI, 2010-07-02

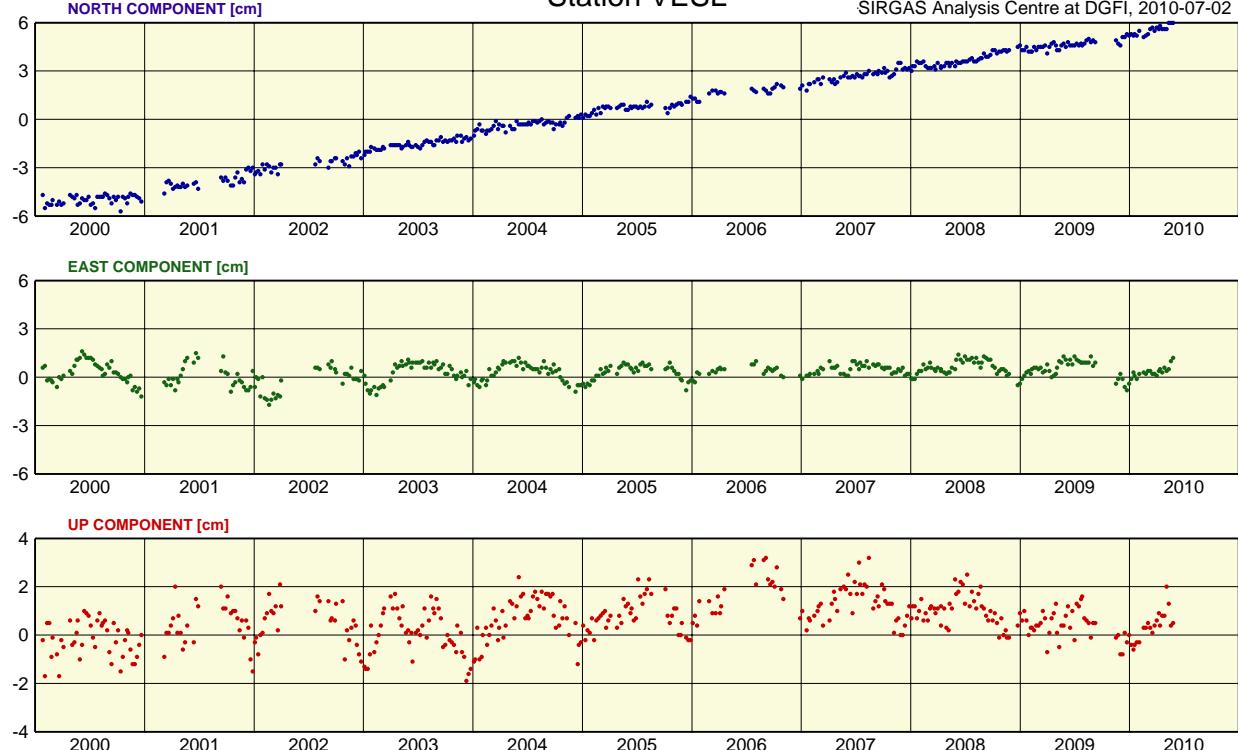

Station VALP

SIRGAS Analysis Centre at DGFI, 2010-07-02

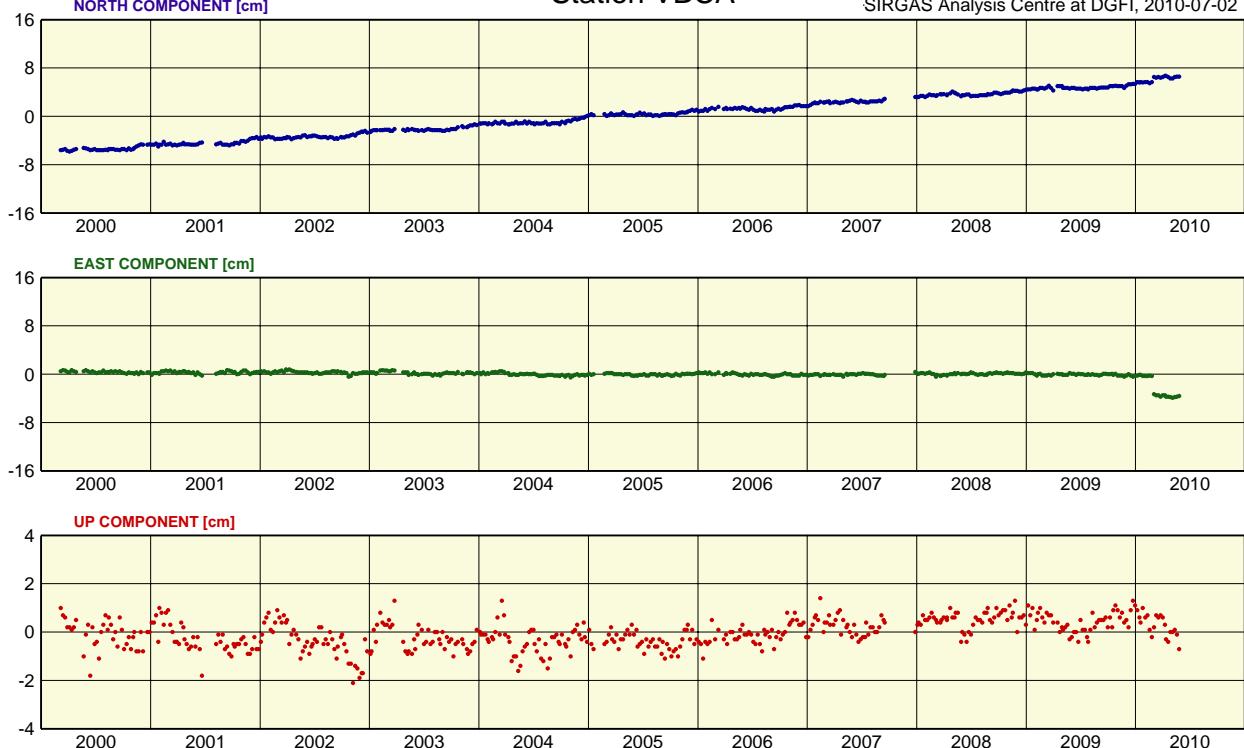

Station VESL

SIRGAS Analysis Centre at DGFI, 2010-07-02

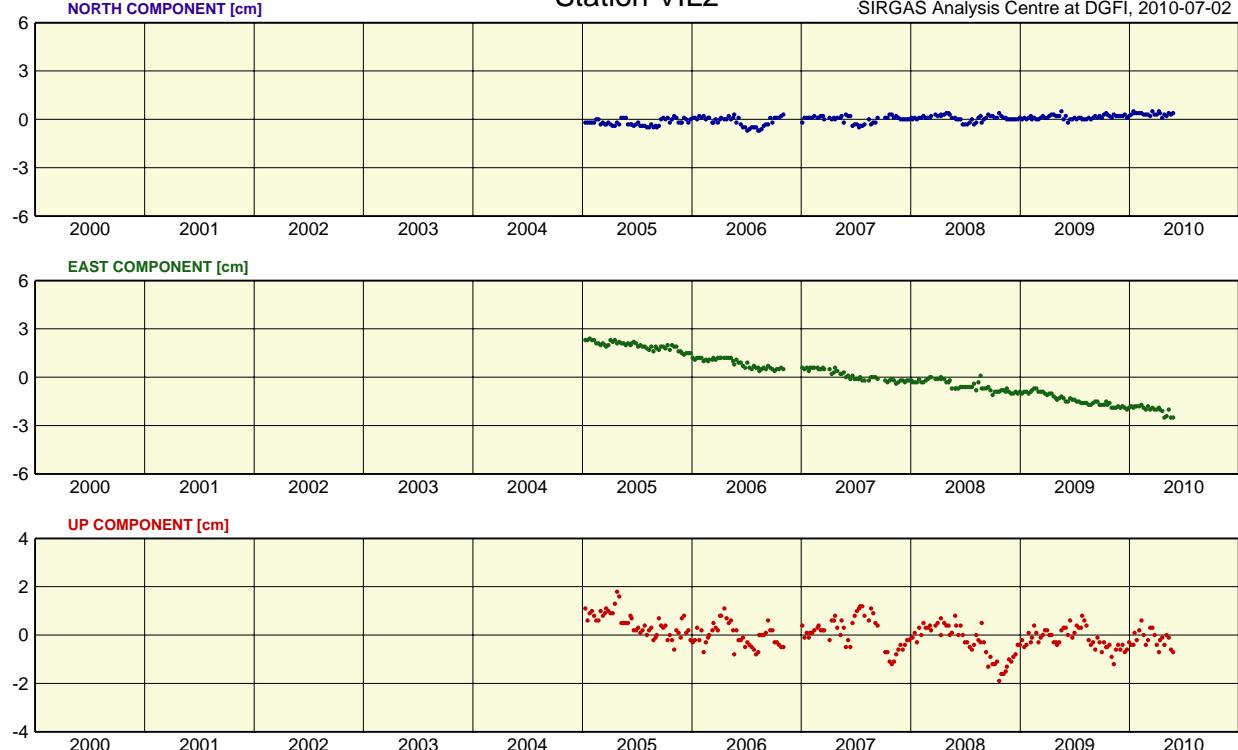

Station VBCA

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station VIL2

SIRGAS Analysis Centre at DGFI, 2010-07-02

Station VICO

SIRGAS Analysis Centre at DGFI, 2010-07-02
